# Overview

## Introduction

This document lists all the tables in the data@work Knowledge Library virtual database for Distribution A+.

This list includes the following information for each table in the Knowledge Library:

- **Table Name** - The Distribution A+ filename for the file this table corresponds to. For example, the ADDR table contains the data in the Distribution A+ ADDR file. For details of the fields in each Distribution A+ file, consult the Version 5.00 Distribution A+ IBM i File Layouts document. You will also be able to see an English language list of all the fields in the table when you are creating a data@work query.
- **Description** - The name of the Distribution A+ file that this table corresponds to.
- **Key Fields** - The primary keys in this table that can be used to link to data in other tables. To create a query using two or more tables
  - the tables must have at least one field in common
  - the common field must be a Key Field in at least one of the tables
  - the Linking Names of the common field(s) must match exactly
- **Changed** - The fields in this column are not primary keys in this table, but are Key Fields in another Knowledge Library table. The Linking Name for each of these fields has been changed from the Distribution A+ variable name to make it match the Linking Name in the table where the field is a Key Field.

NOTE: There may be other fields which are Key Fields in another table and can be used to create links, but which are not listed in this column. This column lists only those fields whose Linking Name has been changed from the original variable name.

- **Linking Name** - The variable name for each field in the Key Fields or Changed columns. To link two or more tables in a query, there must be at least one field that is a Key Field in one table and whose Linking Name is exactly the same in each table.
- **Version** - The version/release in which the table was added to the Knowledge Library.

As a rule, the Linking Names (variable names) for fields are the same as the variable names in the Distribution A+ file the table corresponds to without the two-letter module prefix.

### EXAMPLE

The variable name for the company number in the ADDR file is SACONO. The variable name for the company number in the APHHD file is AACONO. In the Knowledge Library, the variable name has been shortened to CONO in both the ADDR and the APHHD tables.

In a few cases, the last four letters of the variable name have also been changed. These changes have been made so that each field has exactly the same Linking Name in every table where it appears.

#### EXAMPLE

The last four letters of the variable name for the A/R Call Rep ID in the Distribution A+ ARCOM file are ASUS. The last four letters of the variable name for the A/R Call Rep ID in the CUSMS file are ARRP. In the Knowledge Library, the Linking Name for the A/R Call Rep (“Rep”) Key Field in the ARCOM table is ARRP. The Linking Name has been changed so that it will be an exact match to the Linking Name for this same Key Field in the CUSMS table (and other tables), allowing you to link those tables in your queries.

## Using the Knowledge Library

Before you can use data@work, you must apply the Knowledge Library to your installed copy of the CorVu CorBusiness™ software. To do this, follow the instructions in the Applying the *data@work Knowledge Library* section of the *data@work Installation Instructions*.

Be sure to apply the Knowledge Library before using the data@work Knowledge Library option to define any virtual tables or columns. Otherwise, applying the Knowledge Library will wipe out all of your entries, and you will have to define the virtual tables or columns again.

## Using the Virtual Data Base

With data@work, you can access the entire Distribution A+ database, which contains approximately 2,000 tables. If you use the entire database, when you create a query the drop-down table selection window lists all of those tables, making it more difficult and time consuming to find the table(s) you want to use.

To streamline the process of creating queries, Infor has created a virtual database. The virtual database allows you to work with a subset of the Distribution A+ database. This subset contains the most commonly used tables. Using the virtual database means that fewer tables (approximately 200) are listed in the drop-down table selection box. When you work with the virtual database, you are still accessing up-to-date, live data. The Knowledge Library Table Definitions section lists only the tables in the virtual database.

To work with the entire Distribution A+ database, select the database name you created in the installation (e.g., Aplus Database) as the database to use for the query.

To work with the virtual database, select the Aplus Virtual DataBase database. You can use tables from both databases in the same query.

You can also set up additional virtual databases yourself, if necessary. For information on how to create a virtual database, refer to the CorVu CorBusiness™ documentation.

# Rules for Linking Tables

Infor recommends that you attend CorVu customer education and familiarize yourself with the CorVu CorBusiness™ documentation prior to developing any queries with data@work. The following rules are presented as guidelines for linking tables in data@work queries, but should not be considered as a substitute for the CorVu documentation and training.

Use the following rules as a guide for establishing keys when working with complex relationships:

1. A single key column joins to another table if the linking name matches (regardless of whether the column is a key in the second table).
2. A table with a concatenated key (multi-column key) joins to another single table if all components of the key are present in the second table with matching Linking Names.

In the second table, any one of the following may be keyed:

- none of the matching columns
  - a subset of the matching columns
  - all of the matching columns
  - a superset of the matching columns
3. A table with a concatenated key will not join to another non-keyed single table if all components of the concatenated key are not present in the second table.
  4. A concatenated key joins across multiple tables only if the matching columns in the other tables are keys.
  5. A table with a concatenated key will join to another table with a concatenated key if one key is a subset of the other (the same as point #2).
  6. A table with a concatenated key will not join to a table with an alternate concatenated key where there are components of each key with no match.
  7. If an outer join is desired between two tables, the table with missing values must have the column(s) that will be used to join the two tables set as a key column (and only the column(s) that will be used for the join).

## Using Virtual Tables

data@work gives you the ability to set up virtual tables. You can use virtual tables to group fields from different Knowledge Library tables into one table, making that set of fields easier to access when you create a query. The most important use for virtual tables, however, is to set up linking relationships that you cannot create using the existing Knowledge Library tables.

To link tables in data@work, you must have at least one field that:

- exists in both tables
- has the same Linking Name (variable name) in both tables
- is a Key Field in at least one table

If you want to link two tables and there are no common fields that are keys in at least one of the tables, you can use a virtual table to make the link. To do this, create a virtual table that is an image of one of the two existing tables, but has a Key Field that is also in the second table.

#### EXAMPLE

You want to create a report that includes information from the OE Quantity Discount table (QTYDS) and the Vendor Rebate History table (RBHST).

However, these two tables have no common fields that can be used to link them:

	OE Quantity Discount Table	Vendor Rebate History Table
Key Fields	Discount Item Number	Company Number
	Item Group Code	Vendor Number
	Warehouse ID	Rebate ID
	Country ID	Document Code
	Currency Code	Document Number
Changed	(none)	(none)

To create the report, you must first create a virtual table that is a copy of the OE Quantity Discount table, but has a Key Field that also exists in the Vendor Rebate History table, such as Vendor Number. Alternatively, you could create a virtual table that is a copy of the Vendor Rebate History table, but has a Key Field that also exists in the OE Quantity Discount table.

For information on how to create a virtual table, refer to the CorVu CorBusiness™ documentation.

# Knowledge Library Table Definition - Distribution A+
