About this document

This guide describes the setup and the processes of the inbound goods flow.

Objectives

The objectives of this book are to describe the purpose of inbound and inspection orders, what you can accomplish using them, and how to set up and use them.

Intended Audience

This book is intended for those who want to learn how to use inbound, receipts and inspection orders and to set up the inbound functionality in the way that best serves their purposes. Both end users and users on administrator level will find the information they require.

Assumed Knowledge

Familiarity with the business processes involved in handling inbound goods in the warehouse, and general knowledge of the LN functionality will help you understand this book. In addition, Warehousing training courses are available to give you a headstart.

Document summary

The first chapter, *Introduction*, describes the purpose and the general characteristics of inbound, receipts and inspections.

The following chapters deal with master data and parameter setup, describe how inbound advices are created and linked to receipts and inspections.

This book describes procedures that users carry out using inbound process and provide some information on the underlying processes that LN carries out. The most important session windows and fields involved are discussed, but a full description of all software components is outside the scope of this book. For details, refer to the online Help.

How to read this document

This document was assembled from online Help topics. As a result, references to other sections in the manual are presented as shown in the following example:

Please refer to the Table of Contents to locate the referred section.

Underlined terms indicate a link to a glossary definition. If you view this document online and you click on underlined text, you jump to the glossary definition at the end of this document. Non-underlined references do not represent a link to glossary definitions or other elements.

Comments?

We continually review and improve our documentation. Any remarks/requests for information concerning this document or topic are appreciated. Please e-mail your comments to documentation@infor.com.

In your e-mail, refer to the document number and title. More specific information will enable us to process feedback efficiently.

Contacting Infor

If you have questions about Infor products, go to Infor Concierge at <https://concierge.infor.com/> and create a support incident.

If we update this document after the product release, we will post the new version on the Infor Support Portal. To access documentation, select **Search Browse Documentation**. We recommend that you check this portal periodically for updated documentation.

If you have comments about Infor documentation, contact documentation@infor.com.

The inbound process is used to receive and store goods in a warehouse. To receive and store goods in a warehouse, you can process the inbound order lines on which the goods are listed, or you can process the handling units used to pack the goods. Both inbound order lines and handling units are processed according to user-defined warehousing procedures. If you use handling units to process goods, the order lines related to the handling units are updated in the background.

Inbound order lines

Inbound order lines deal with activities that relate to the receipt of goods in a warehouse.

Inbound-order line characteristics

Warehouse inbound order lines are related to the following inventory transaction types:

- **Receipt**
- **Transfer**
- **WIP Transfer**

An inbound order line is generated either automatically by another package or module, or created manually in Warehousing. The order type determines the default warehousing procedure steps that must or can be taken to process the order lines. You can adjust the default warehousing procedure for an individual order header. As a result, the adjusted procedure applies to the order lines that belong to the order header. You can also adjust the procedure for an individual order line.

The physical acceptance of an item into a warehouse. A receipt registers: received quantity, receipt date, packing-slip data, inspection data, and so on.

A notification that a shipment has been sent. Advanced shipment notices are sent and received by means of EDI. You can receive advance shipment notices from your supplier informing you that goods are to arrive at your warehouse, and/or you can send advance shipment notices to your customers that the goods they ordered are about to be delivered.

Warehouse inspections and order origin

In Warehousing, inspections are possible for all order origins, including manual orders. In Quality, however, no inspection orders can be created for the following (manual) order origins:

- Sales (Manual)
- Service (Manual)
- Maint. Sales (Manual)
- Maint. Work (Manual)
- SFC Production (Manual)
- ASC Production (Manual)
- Transfer (Manual)
- Project (Manual)
- Purchase (Manual)

If the warehouse inspection activity is part of the order type, this activity must be added as an order step for the applicable order origin, when users create activities in any of the following sessions:

- Activities by Warehousing Order (whinh2104m000)
- Activities by Inbound Order Line (whinh2114m000)
- Activities by Outbound Order Line (whinh2124m000)

If, for example, a manual inbound order line or transfer order line is received (and put away), a warehouse inspection line must be created.

Inbound warehouse inspections can be approved, rejected or destroyed, whereas *outbound* warehouse inspections can only be approved or rejected.

The following should be taken into account:

- Rejections for **Purchase (Manual)** orders are handled in the same way as for **Purchase** orders and **Purchase Schedules**. For these order origins the original receipt transaction is reversed. For all other order origins rejections are handled by creating an adjustment order for the rejected quantity.
- The usage of Rejected Inventory (whwmd2570m000) session is based on the parameter settings.
- LN handles the rejected inventory against the specification as determined in the original purchase order and purchase order line.

As a result, handling rejected inventory is not possible for **Purchase (Manual)** orders, because:

- There is no purchase (return) order for returning the rejected inventory.
- Destroying can be performed directly from the warehouse inspection.

The following table summarizes handling of destroyed or rejected inventory and is applicable if the **Handle Rejected Goods** check box is not selected in the Inventory Handling Parameters (whinh0100m000) session and the inventory is inspected in a regular process which is Approve or Scrap, based on order origin.

Order Origin	Inbound Inspections		Outbound Inspections
	Destroy	Reject	Reject
Purchase	Adjustment order	Reverse original order	Adjustment order
Purchase Schedule			
Purchase (Manual)			
Other origins	Adjustment order	Adjustment order	Adjustment order

To define warehousing order types

Warehousing order types determine how warehousing orders are handled. Warehousing order types are classified by inventory transaction type. The inventory transaction type that you add to a warehousing order type determines the type of warehousing procedure that you can link to the warehousing order type. The activities that must be carried out in order to handle warehousing orders are, by default, determined by the warehousing procedures that are linked to the warehousing order types.

Warehousing order types are linked to warehousing orders when warehousing orders are generated from other packages or when you manually create a warehousing order in the Warehousing Orders (whinh2100m000) session.

Define warehousing order types

In the Warehousing Order Type (whinh0110m000) session, you can specify warehousing order types for the following inventory-transaction types:

- **Receipt**
Use a warehousing order type of inventory transaction type **Receipt** to receive goods in a warehouse. You can link a **Receipt Procedure** and, optionally, an **Inspection Procedure** to a warehousing order type of inventory transaction type **Receipt**.
- **Issue**
Use a warehousing order type of inventory transaction type **Issue** to issue goods from a warehouse. You can link a **Outbound Procedure** and a **Shipment Procedure** to a warehousing order type of inventory transaction type **Issue** **Note:** LN allows you to modify the outbound order line data based on the value the **Allow Updating Outbound Order Lines upto and including** field is set to in the Warehousing Order Types (whinh0110m000) session.
- **Transfer**
Use a warehousing order type of inventory transaction type **Transfer** to transfer goods between warehouses, locations, business partners, projects, or work centers.
You must link these procedures to a warehousing order type of inventory transaction type **Transfer**:
 - **Receipt Procedure**

- **Inspection Procedure**
- **Outbound Procedure**
- **Shipment Procedure**

A transfer involves either one or two warehouses. If items are transferred between two different warehouses, all activities of the warehousing procedures must be carried out. However, if a transfer takes place between two locations within the same warehouse, the receipt activities are not carried out. You can use transfer orders to define a replenishment system within a single warehouse. This system controls replenishment from bulk locations to pick locations.

Note: LN allows you to modify the outbound order line data based on the value the **Allow Updating Outbound Order Lines upto and including** field is set to in the Warehousing Order Types (whinh0110m000) session.

- Inspections in LN Quality are possible for warehouse orders having order origin **Transfer (Manual)** only if the QM Implemented parameter is selected for the order type **Warehouse Transfer** in the Quality Management Parameters (qmptc0100m000) session.
- **WIP Transfer**
Use a warehousing order type of inventory transaction type **WIP Transfer** to transfer work from one costing work center to another.

To define warehousing procedures

To model the inbound, storage, and outbound goods flows in your warehouse, you can define warehousing procedures in LN. A warehousing procedure includes various steps called activities that control the way warehousing orders and/or handling units are processed. An activity is performed using a particular LN session.

Link warehousing procedures to inbound and outbound goods

Initially, you define a warehousing procedure and link this procedure to a particular warehousing order type. As a result, the warehousing procedure is the default procedure for the warehousing orders to which the order type is allocated, and the goods are processed according to the procedure of the order on which the goods are listed.

If you use handling units to process goods into and/or out of the warehouse, the goods are processed according to the warehousing procedure of the warehousing orders that list the goods contained in the handling units.

You can adjust the default procedure for individual warehousing orders and warehousing order lines of this warehousing order type. If you adjust the default procedure for an individual warehousing order of this order type, the adjusted procedure applies to the inbound and/or outbound order lines of the warehousing order. You can also adjust the warehousing procedure for an individual inbound or outbound order line. For further information, see [How to modify warehousing procedures](#).

Automatic or manual execution of activities

You can specify whether an activity of a warehousing procedure must be carried out manually or automatically. Manually means that the user must perform the activity using the session related to the activity. Automatic means that the activity is carried out automatically after the preceding activity is finished. If the first activity is automatic for warehousing orders generated from orders originating from other packages, this activity is carried out the moment the warehousing order is generated. For information on how to define a warehousing procedure and specifying whether the activities of the procedure are carried out manually or automatically, see *How to define a warehousing procedure*.

However, to trigger warehouse processing for warehousing orders whose first activity is set to automatic processing and that are manually created or generated from Project, you must click Process.

The Process command is available in the following sessions:

- Warehousing Orders (whinh2100m000)
- Warehousing Order (whinh2100m100)
- Warehouse Manager Dashboard (whinh2300m000)
- Warehousing Assembly Order (whinh2101m000)
- Inbound Order Lines (whinh2110m000)
- Outbound Order Lines (whinh2120m000)

How to receive goods

This topic describes how to create receipts and link various types of records to the receipts. After creating receipts, you must confirm the receipts before you can store the goods in the warehouse. How to confirm receipts is described in *Confirming receipts and receipt lines* (p. 18). For a general overview of receipt procedures, see *Receipt and inspection procedures* (p. 37).

You can perform the receipt of goods in the Warehouse Receipts (whinh3512m000) session. In this session, you can receive goods listed on the following types of records:

- Advance shipment notices (ASNs)
- ASN lines
- Expected orders
- Expected order lines
- Handling units
- Loads and shipments from the Planned Loads/Shipments (whinh4180m000) session and the Shipments (whinh4130m000) session.

Expected orders are inbound warehousing orders that are expected to be received in (one of) your warehouses. Expected orders are displayed in the Expected Orders (whinh3822m000) session. Expected order lines are inbound warehousing order lines that are expected to be received in (one of) your warehouses. Expected order lines are displayed in the Expected Order Lines (whinh3820m000) session.

In this session, you can also record unexpected goods, that is, goods for which no expected order (line) exists yet.

Note

To receive goods based on handling units, see To receive handling units.

How to create a receipt

To create a new receipt record, proceed as follows:

1. In the Warehouse Receipts (whinh3512m000) session, click , or from the appropriate menu, select **New**.
2. If the **Receipt** field is in entry mode, select a receipt series or use the default series.
Note that the **Select Receipt Series** check box and the **Receipts** field in the User Profiles (whwmd1140s000) session determine whether the **Receipt** field is in read-only or entry mode.
3. If the **Warehouse** field is in entry mode, select a warehouse.
Note that the **Warehouse** field in the User Profiles (whwmd1140s000) session determine whether the **Warehouse** field is in read-only or entry mode.
4. If required, specify the ship-from business partner and also specify the **Packing Slip** and the **Receipt Date** in the **Delivery** group box. The **Packing Slip** provides the ID of the party that delivers the goods to be received and the **Receipt Date** provides the date on which the receipt header is created.
Note that default values for these fields are filled from the receipt lines after you have linked inbound-order lines, advance shipment notices, or handling units to the receipt.

How to link order lines, ASNs, loads, shipments, or handling units to a receipt

After you create a receipt, you must link inbound order lines, advance shipment notices, shipments, loads, or handling units to the receipt. As a result, LN creates receipt lines for the linked inbound order lines and the inbound order lines on which the linked handling units, shipments, loads, or ASN lines are based.

The following options are available to link these types of records to a receipt:

Option	Available for record type	Refer to
Receive (Easy Entry)	Inbound order lines, ASN lines, ASN line reference, handling units, loads and shipments	Receive (Easy Entry)
High Volume Entry	Inbound order lines	High Volume Entry
Expected Orders	Inbound order lines	To link expected order lines
Receipt Filter	Inbound order lines, ASN lines, handling units, planned loads and shipments	Receipt Filter
Expected Shipments	ASN lines	To link expected shipment lines to receipts

To receive unexpected goods

When an item arrives for which no expected order (line) is present, you can use the **Add Unexpected Receipt Line** command to create a temporary receipt line in which you can enter receipt details.

To confirm and process the unexpected receipt line, an order line must be available for the unexpected receipt line. The order line must be released to warehousing. If the order line is released to warehousing, you can link the resulting warehousing order line to the unexpected receipt by means of the **Link Order to Unexpected Receipt Line** command in the Warehouse Receipts (whinh3512m000) session.

Automatic receipts

LN automatically carries out receipts and update the normal (nonadministrative) warehouse with the inventory received in the "real" VMI warehouse. Automatic receipts are used to limit the receipt administration but not to update the administrative warehouses. Automatic receipts are based on purchase orders, contractual inventory levels, or demand forecast. While the automatic receipts are booked into the administrative warehouse, the goods listed on them are actually received in the "real" VMI warehouse managed by the supplier.

For automatic receipts into the customer's administrative warehouse, you can generate automatic receipt records in the Initiate Automatic Receipts (whinh3223m000) session.

After receipt

After you have performed the receipt of goods, the receipt must be confirmed. After confirming the goods, the next step of the applicable warehousing procedure can be carried out.

Confirming receipts and receipt lines

After you create receipts, you must confirm the receipts. When you confirm a receipt, you can either confirm the entire receipt, or confirm individual receipt lines of the receipt.

To confirm a receipt

To confirm an entire receipt, proceed as follows:

1. On the appropriate menu, select the **Confirm** submenu.
2. From the **Confirm** submenu, select **Receipt**.

You can also confirm the receipt using the **Confirm** option from the Confirm Receipt menu in the Warehouse Receipt (whinh3512m000) session.

You can also confirm various receipts at the same time. In the Warehouse Receipt (whinh3512m000) session, from the Confirm Receipt menu; select **Receipts** to start the Confirm Receipts (whinh3212m000) session in which you can select a range of receipts and confirm the range.

To look up a receipt

To confirm a receipt, you may have to look up the receipt first. To look up a receipt:

Receipt number known

If you know the receipt number, take the following steps:

1. press Ctrl-F.
2. In the dialog box that appears, enter or browse for the receipt number of the receipt you want to confirm and click OK.

Receipt number unknown

If you do not know the receipt number, take the following steps:

1. On the appropriate menu, select the **Receipt** submenu, and from the **Receipt** submenu, select **Switch to Receipt**.
2. In the Warehouse Receipt Headers (whinh3110m000) session that appears, select the required receipt. If required, click **View** and select one of the options to narrow down the number of receipts displayed in the Warehouse Receipt Headers (whinh3110m000) session.

To confirm a receipt line

To confirm the receipt of a receipt line, proceed as follows:

1. Select the receipt line or receipt lines that you want to confirm.

2. In the Lines tab, select the receipt line, and click **Confirm**.

LN actions triggered by confirming receipts or receipt lines

After you confirm a receipt or receipt line, LN:

- Updates the item's inventory in the receiving warehouse in the Warehouse - Item Inventory (whwmd2515m000) session. The packing structure data and reusable packaging items inventory is updated as well.
- Balances the negative inventory with the received quantity.
- Updates the LN package from which the receipt originated, with the receipt line information. For example, if a receipt for an order of origin **ASC Production** is confirmed, this order obtains the **Completed** status, unless inbound inspection is required. In that case, the **Completed** status is obtained after the inspection is completed.
- Sends a discrepancy notice to the supplier if the received quantity is not equal to the shipment-notice line quantity. LN only sends a discrepancy notice if shipment notices are used.
- Carries out logistic transactions and financial transactions.
- Creates an approval line in the Warehouse Inspections (whinh3122m000) session if the received items must be inspected.
- Automatically generates inbound advice for the receipt (line) if the Generate Inbound Advice (whinh3201m000) session is not an automatic activity in the applicable receipt procedure.
- Logs the result of the receipt process in the Receipt Message Log (whinh3530m000) session. LN logs error messages and information messages. Note that the information of the Receipt Message Log (whinh3530m000) session is displayed in the Message Log tab of the lines pane in the Warehouse Receipts (whinh3512m000) session if you select **Show All Form Pages** in the **Receipts Satellites** group box of the User Profiles (whwmd1140s000) session.

Advance Shipment Notice

Length of ASN Number

LN allows you to limit the length of generated shipment and load numbers and, therefore, the length of the ASN number. This feature makes it possible to satisfy requirements and standards of specific branches of industry, such as the VDA standard which limits the length of the ASN number to a maximum of 8 characters. VDA (Verband der Automobilindustrie) is a German organization which serves the interests of the automobile industry.

Example

The example below illustrates how a load or shipment number is generated.

Length Series = 3

Series = AAA

First Free Number = 23

Load Length / Shipment Number = AAA00023
Length = 9

Load Length / Shipment Number = AAA0023
Length = 8

Load Length / Shipment Number = AAA023
Length = 6

When LN creates loads and shipments in Freight, LN applies the **Load Length** and **Shipment Length** defined in the Inventory Handling Parameters (whinh0100m000) session of Warehousing.

Note

When Freight is implemented and no Warehousing parameters are defined, LN uses the actual length of the load and shipment fields.

Searching for ASN error messages

The supplier's ASN number is the most frequently used number if you use Advanced Shipment Notices (ASNs) to support the process of receiving goods in the warehouse. You can create receipt of goods from a supplier's ASN number using the **Receive (Easy Entry)** group box in the Warehouse Receipts (whinh3512m000) session. You can specify a supplier's ASN number in the **Number (Line)** field in the Warehouse Receipts (whinh3512m000) session to create receipt of goods.

When an EDI message is received, an ASN is created. Sometimes an EDI message is received in the LN Electronic Commerce package, but the ASN/shipment notice is not created in the Warehousing because of an error when processing the EDI messages. The EDI message may result in an error when the message is received electronically from the supplier. In this scenario, when LN cannot find the supplier's ASN number in the Warehousing at the time of receipt, LN does the following:

- Checks for the EDI warning/error messages and display these messages to the user.
- Lists the EDI warning/error messages in the Receipt Message Log (whinh3530m000) session. If LN finds an ASN, a receipt line is created.
If LN cannot find the supplier's ASN number in the Warehousing at the time of receipt, but error/warning messages exist for the received EDI message, LN logs the receipt messages

in the Receipt Message Log (whinh3530m000) session with the value of the **Receipt Line** field set to zero.

Note

When you delete the receipt header from the Shipment Notices (whinh3100m000) session, the receipt messages for which the value of the **Receipt Line** field is zero are deleted from the Receipt Message Log (whinh3530m000) session.

Automatic Receipts

Automatic receipts

Automatic receipts update the normal (non-administrative) warehouses with the inventory received in the "real" VMI warehouse. Automatic receipts are used to restrict receipt processing.

The customer's administrative warehouse

For automatic receipts into the customer's administrative warehouse, you can generate automatic receipt records in the Initiate Automatic Receipts (whinh3223m000) session.

The generated receipt records are displayed in the Automatic Receipts (whinh3523m000) session. These records include data such as the warehouses in which the receipts are to take place, the item quantities, and the dates on which the automatic receipts are to take place. When the automatic receipt date is due, LN performs the automatic receipts in the administrative warehouse.

Automatic receipts are based on purchase orders, contractual inventory levels, or demand forecast.

If the supplier performs supply planning for the customer, an automatic receipt can be based on the quantities listed in the demand forecast that the customer sends to the supplier, or the confirmed supply based on the demand forecast that the supplier sends to the customer.

For more detailed information about the automatic receipt creation process, see *The automatic receipt process* (p. 22).

Various parameters determine how LN creates automatic receipts. For more information, refer to *Setting up automatic receipts* (p. 24).

The supplier's administrative warehouse

In this situation, the supplier plans replenishment and replenishes the warehouse, which is managed by the customer, where the warehouse is a real/ physical warehouse. The warehouse is defined as an administrative warehouse in the supplier's system. The supplier assumes that the quantities that he shipped equal the quantities received by the customer.

The supplier's administrative warehouse is updated by means of transfer orders. When the supplier issues goods to replenish the "real" warehouse, he creates a transfer order that is received into the

administrative warehouse. When he confirms the shipments of the transfer order, LN creates a receipt based on the transfer order and automatically confirms the receipt. The receipt quantities are equal to the confirmed quantities of the shipments.

The automatic receipt process

Creating automatic receipt records

To create automatic receipts into the customer's administrative warehouse, LN:

1. Creates combinations of buy-from business partners, warehouses, and items based on the selections specified in the Initiate Automatic Receipts (whinh3223m000) session. LN retrieves this data from the Warehouse - Item (whwmd2110s000) session and the Items - Purchase Business Partner (tdipu0110m000) session.
2. Checks the automatic receipt settings in the terms and conditions for these combinations. For more information, refer to *Setting up automatic receipts* (p. 24).
3. Creates the automatic receipt records in the Automatic Receipts (whinh3523m000) session for these combinations.

The initial status of an automatic receipt record is **Open**.

Receipt record basis

How LN creates the automatic receipt records, and which data they include depends on the type of data the automatic receipt records are based on. If based on:

- **Purchase orders**
LN:
 - a. Calculates the automatic receipt dates as described in *Setting up automatic receipts* (p. 24).
 - b. Stores these in the automatic receipt records.
 - c. Adds the receipt quantities to the automatic receipt records when actually performing the receipt on the automatic receipt date, see Performing automatic receipts.
- **Forecast demand**
LN:
 - a. Retrieves the planned receipt quantities from the Enterprise Planning package.
 - b. Stores these in the following fields of the Automatic Receipts (whinh3523m000) session:
 - **Planned Receipt Quantity in Receipt Unit**
 - **Planned Receipt Quantity in Inventory Unit**
 - c. Retrieves the automatic receipt dates from Enterprise Planning or the receiving interval from the terms and conditions.

- **Contractual inventory levels**

LN:

- a. Calculates the automatic receipt dates from the delivery moments defined in the terms and conditions.
- b. Retrieves the planned inventory level for the automatic receipt dates from the terms and conditions.
- c. Stores the automatic receipt dates and planned inventory levels in the **Automatic Receipt Date** field and the **Planned Inventory Level** field, respectively, of the Automatic Receipts (whinh3523m000) session.

Performing automatic receipts

On the automatic receipt date, LN performs receipts for the automatic receipt records as follows:

1. Create warehousing receipt lines for the automatic receipt records.
2. Link the receipt lines to the purchase orders present for the business partners, warehouses, items, and date ranges specified by the user in the Initiate Automatic Receipts (whinh3223m000) session.
3. If no purchase orders are present, create purchase orders according to the **Receipt Triggered Order** field in the Order Terms and Conditions (tctrm1130m000) session. If the value in this field is **Not Allowed**, an error message appears and the automatic receipt is not performed for the automatic receipt record.
Purchase orders are not present if the automatic receipts are based on forecast demand or contractual inventory levels. For more information, refer to Purchase orders, forecast demand, or inventory levels.
4. Generate low volume lot or serial numbers if not present.
5. Generate High volume scenario lot or serial numbers according to the lot and serial registration templates. For more information, refer to Lot and serial registration templates.
6. Confirm the automatic receipt record.
7. In the Automatic Receipts (whinh3523m000) session, set the status of the automatic receipt record and show the received quantities.
8. Within the date range specified in the Initiate Automatic Receipts (whinh3223m000) session, LN looks for automatic receipt dates. If an automatic receipt date is due, the automatic receipts for that date are performed. The process lies dormant until an automatic receipt date is due, or if the date range is expired.

Purchase orders, forecast demand, or inventory levels

How LN retrieves the quantities to be received depends on the type of data the automatic receipt records are based on. If based on:

- **Purchase orders**

LN:

- a. Checks the purchase orders retrieved for the receipt records.

- b. Receives the purchase order quantities as described in Receipt record basis.
- **Forecast demand**
LN:
 - a. Creates receipt triggered purchase orders for the automatic receipt records.
 - b. Receives these into the warehouse. The quantities to be received are taken from the **Planned Receipt Quantity in Receipt Unit** field and the **Planned Receipt Quantity in Inventory Unit** field of the Automatic Receipts (whinh3523m000) session. For more information, refer to Receipt record basis.
- **Contractual inventory levels**
LN:
 - a. Creates receipt triggered purchase orders for the automatic receipt records.
 - b. Receives these into the warehouse.
 - c. Determines the quantities to be received by comparing the planned inventory level from the **Planned Inventory Level** field in the Automatic Receipts (whinh3523m000) session to the inventory on hand from the receiving warehouse. If on the automatic receipt date the inventory level is within the contractual inventory levels, LN performs no receipt.

Setting up automatic receipts

Creating automatic receipts into the customer's administrative warehouse requires the following settings in the Terms and Conditions module of the Common package:

- Terms and conditions must be linked to an active purchase contract.
- The terms and conditions are not expired.
Multiple valid sets of terms and conditions can be present for the selection ranges that the user specifies in the Initiate Automatic Receipts (whinh3223m000) session. Terms and conditions have effective and expiry dates. If terms and conditions overlap, that is, range effective-expiry dates overlap, LN selects the terms and conditions with most recent effective date.
- In the Logistics Terms and Conditions (tctrm1140m000) session:
 - The value in field **Method of Inventory Update** is either of the following:
 - **Receipts and Consumptions**
 - **Receipts, Consumptions and Inv. Balance**
 - The value in field **Receiving Process** is **Automatic (Delivery Moments)**.
 - The **Delivery Moments** field determines whether creation of automatic receipts is based on purchase orders, demand forecast, or inventory levels. If the value is:
 - **Orders and Schedules**, creation of receipt records is based on purchase orders.
 - **Forecast or Inventory Levels**, creation of receipt records is based on demand forecast or inventory levels.
- In the Item - Purchase Business Partner (tdipu0110m000) session, the **Generate Order for Unexpected Warehouse Receipt** check box is selected.

- In the Order Terms and Conditions (tctrm1130m000) session, the **Receipt Triggered Order** field value is **Purchase Order** or **Purchase (Manual) Order**.

Automatic receipts based on purchase orders

In the Order Terms and Conditions (tctrm1130m000) session:

- If the **Use Confirmation** check box is selected, only confirmed purchase orders are used to create automatic receipts. If this check box is cleared, both confirmed and unconfirmed purchase orders are used.
- If you define a receiving interval in the **Receiving Interval** field of the Logistics Terms and Conditions (tctrm1140m000) session, LN uses this interval to determine the automatic receipt dates. The automatic receipt date is the date on which LN performs an automatic receipt.
Note that purchase orders created between receipt intervals are not taken into account until the next automatic receipt date.
If no receipt interval is defined, the planned receipt dates of the purchase orders are used to determine the automatic receipt dates. For more information, refer to *The automatic receipt process* (p. 22).

Automatic receipts based on demand forecast

In the Planning Terms and Conditions (tctrm1135m000) session, do the following if automatic receipts must be based on demand forecast:

- Select the **Supply Planning by Supplier** check box.
- Select the **Use Confirmed Supply** check box if automatic receipts must only be based on confirmed supply.
- In the **Replenishment Based On** field, do not select **Manual** or **Inventory Level**.
- If you define a receiving interval in the **Receiving Interval** field of the Logistics Terms and Conditions (tctrm1140m000) session, LN uses this interval to determine the automatic receipt dates. The automatic receipt date is the date on which LN performs an automatic receipt.
If no receipt interval is defined, the planned receipt dates Enterprise Planning are used to determine the automatic receipt dates. For more information, refer to *The automatic receipt process* (p. 22).

Automatic receipts based on inventory levels

In the Planning Terms and Conditions (tctrm1135m000) session, do the following if automatic receipts must be based on contractual inventory levels:

- Select the **Supply Planning by Supplier** check box.
- Select the **Send Forecast to Supplier** check box.
- In the **Replenishment Based On** field, select **Manual** or **Inventory Level**.
- Select a pattern code in the **Delivery Moments** field.

- Define minimum and/or maximum levels in the fields of the **Inventory Levels** tab.

Approvals and inspections

In many, but not all warehouses, inspections are included in the inbound and/or outbound goods flow. Therefore, the inspection procedure is optional in LN. You can inspect received items and items to be shipped. You can carry out inspections in the Warehouse Inspections (whinh3122m000) session. For example, you can use inspections for the following reasons:

- To check the quality of goods ordered from a new supplier.
- To monitor a supplier with a history of quality problems.
- To check the quality of outbound goods that were damaged on the way to the staging location.

Inspection of received items

To enable received items to be inspected in Warehousing, you must set up the following data:

- If your warehouse is location-controlled, your warehouse must have a location of the **Inspection** type. In the Warehouses (whwmd2500m000) session, you can specify whether a warehouse has locations. In the Warehouse - Location (whwmd3100s000) session, you can specify the locations of the warehouse.
- An inspection procedure must be specified for the warehousing order lines of the received goods. The first activity of the inspection procedure must be the Warehouse Inspections (whinh3122m000) session.
- For purchased items, at least one of the following check boxes must be selected. If you select one of the following check boxes, the **Inspection** check box on the Purchase Order Lines (tdpur4101m000) session is selected, or you are enabled to select this check box:
 - The **Inspection** check box on the Item - Purchase (tdipu0101m000) session
 - The **Inspection** check box on the Item - Purchase Business Partner (tdipu0110m000) session
 - The **Inspection** check box on the Ship-from Business Partners (tccom4121s000) session

If you receive items for which inspection is required, in the Warehouse Inspections (whinh3122m000) session, LN creates an approval record for the quantity of items to be inspected.

You can use the Warehouse Inspections (whinh3122m000) session to approve, reject, or destroy goods. The destroyed quantity is part of the approved quantity and removed from inventory. The destroyed quantity is part of the approved quantity because the supplier must be paid for the destroyed goods. The supplier must be paid for the destroyed goods, because usually the goods were destroyed for testing purposes or by some accident, for which the supplier is not liable.

You can perform multiple inspections on a receipt line, which has the following advantages:

- You can give various rejection reasons for a receipt line.
- You can put away approved goods without waiting for the entire order to be inspected.

For information on rejected goods, see *Rejected inventory* (p. 29)

After an inspection is completed for an order of origin **ASC Production**, this order obtains the **Completed** status. For more information, refer to *To store finished generic items*.

Quality

After receipt, LN checks whether Quality related activities are applicable to the item, the order, and/or the supplier. If so, the inspection is carried out by Quality and the inspection results are reported in the Warehouse Inspections (whinh3122m000) session. If Quality inspection results are not mandatory, you can execute them in the Warehouse Inspections (whinh3122m000) session. You must always confirm inspection results by approving them in the Warehouse Inspections (whinh3122m000) session, which enables you to go on with the inspection procedure.

If Quality does not apply, LN checks whether inspection is required for the order in Warehousing. In the **Quality Management (QM)** field of the Implemented Software Components (tccom0100s000) session, you can specify whether Quality is implemented. In the Quality Management Parameters (qmptc0100m000) session, you can specify the order origins for which you want to use Quality.

Inspection of items to be shipped

If you want to inspect outbound items, you must define an outbound procedure for the related outbound order. The last activity of the outbound procedure must be the Warehouse Inspections (whinh3122m000) session.

As a rule, outbound items are inspected on a staging location and not on an inspection location. If items are rejected, LN automatically generates and processes an adjustment order with a reason code for the rejected items. You can view the adjustment order in the Processed Adjustment Order History (whinh5570m000) session. The approved quantity will be shipped.

You can perform multiple inspections on a shipment line, which has the following advantages:

- You can give various rejection reasons for a shipment line.
- You can ship approved goods without waiting for the entire order to be inspected.

Inventory inspection orders

Inventory inspections on the incoming and outgoing goods result in rejection and approval of the goods. After approval, goods are stored in the warehouses.

Inspections of the goods result in advice quantities for approval or rejection. *The inventory inspections are performed only in Quality.*

Rejected inventory

You can use LN to store and handle rejected goods in a warehouse. Rejected inventory can also be stored and handled in a specific location, called a reject location.

LN handles rejected inventory against the specification as determined in the original purchase order and purchase order line.

To handle rejected inventory, the standard rejected inventory handling and inventory disposition methods are available. For more information, refer to *Inventory disposition (p. 29)* and *To handle rejected inventory*.

Inventory disposition

Inventory disposition

Inventory disposition is an alternative method to handle rejected inventory. To use this method, in the Inventory Handling Parameters (whinh0100m000) session, select the **Inventory Disposition** check box.

The main differences with the standard quarantine inventory handling functionality are:

- When a receipt is confirmed, the received quantity is registered as approved on the purchase order line. The approved quantity is not updated after items are rejected in the Warehouse Inspections (whinh3122m000) session. Updates follow after processing the quantities in the Rejected Inventory (whwmd2570m000) session.
Therefore, the entire received quantity can be invoiced and paid while the rejected quantity awaits further processing in the Rejected Inventory (whwmd2570m000) session. This avoids risking late payments to the supplier due to time-consuming disposition procedures. Settlements for destroyed or returned goods can take place after processing.
- After rejecting inventory in the Warehouse Inspections (whinh3122m000) session, LN generates no financial integration transactions or (potential) back orders.

- In the Rejected Inventory (whwmd2570m000) session, after:
 - Accepting rejected inventory, LN creates no new receipt but directly creates inbound advice to the storage location. If the warehouse is not location controlled, LN directly puts away the accepted inventory.
 - Destroying rejected inventory, LN creates no back orders nor is the supplier paid or debited.
 - Returning rejected inventory, the ownership of goods does not change. For company owned return items, the supplier is charged, because the items were paid for after receipt.
- To specify whether rejected inventory in the Rejected Inventory (whwmd2570m000) session must be available for planning methods such as Enterprise Planning, TPOP, or SIC, you can select or clear the **Disposition Inventory Blocked for Planning** check box in the Inventory Handling Parameters (whinh0100m000) session. If most of the inventory in disposition is presumably accepted, consider clearing this check box to make this inventory available for planning, thus avoiding the risk that too much replenishment is planned based on too low inventory levels.
- Disposition items in the reject location are valued identically to items in receipt locations. On the inventory valuation report, disposition items are listed with the original receipt value.

For standard rejected inventory handling and inventory disposition, the steps that the user completes to accept, destroy, or return rejected inventory are identical, as are some of the steps that LN completes to process these user steps. For more information, refer to *To handle rejected inventory*. For information on the LN process steps that are unique to inventory disposition, see:

- *Inventory disposition - to accept rejected inventory (p. 30)*
- *Inventory disposition - to destroy rejected inventory (p. 31)*
- *Inventory disposition - to return rejected inventory (p. 31)*

Inventory disposition - to accept rejected inventory

LN performs the following steps:

- If the **Disposition Inventory Blocked for Planning** check box is selected in the Inventory Handling Parameters (whinh0100m000) session, unblock the quantity accepted in the Rejected Inventory (whwmd2570m000) session.
- If present, decrease the blocked quantity in the following sessions:
 - The item inventory sessions, such as the Warehouse - Item Inventory (whwmd2515m000) session.
 - Project Inventory (whwmd2560m000)
 - Consigned Receipts (whwmd2550m000)
 - Customer Owned Receipts (whwmd2550m100)
- If the warehouse is non location controlled, put away the accepted goods in the warehouse.
- If location controlled, advise goods to storage location after user creates inbound advice. If inbound advice is automatic according to warehousing procedure, generate inbound advice.
- Put away inbound advice.

Note

Contrary to standard rejected goods handling, LN generates no:

- Adjustment order to remove accepted goods from reject location.
- Receipt line to again receive the accepted goods.

This is because accepted inventory is directly moved to storage or through inbound advice.

You cannot cross-dock and run direct material supply for goods that were accepted after rejection.

Inventory disposition - to destroy rejected inventory

LN performs the following steps:

- If the **Disposition Inventory Blocked for Planning** check box is selected in the Inventory Handling Parameters (whinh0100m000) session, unblock the quantity destroyed in the Rejected Inventory (whwmd2570m000) session for planning.
- If present, decrease the blocked quantity in the following sessions:
 - The item inventory sessions, such as the Warehouse - Item Inventory (whwmd2515m000) session.
 - Project Inventory (whwmd2560m000)
 - Consigned Receipts (whwmd2550m000)
 - Customer Owned Receipts (whwmd2550m100)
- In the Project Inventory (whwmd2560m000) session, subtract the destroyed quantity from the on-hand quantity.

Inventory disposition - to return rejected inventory

LN performs the following steps:

- Automatically select the **Return Disposition Goods** check box in the Warehousing Orders (whinh2100m000) session for the warehouse order generated from the purchase return order.
- Copy the values of the ownership fields from the original purchase order to the outbound order lines. For more information, refer to Ownership for outbound order lines of purchase return orders.
- Advise rejected items according to the ownership fields. Consigned and customer owned *rejected* items are allocated for outbound according to the **Issue Strategy** and **Issue Ownership** fields.

View allocations for customer owned and consigned receipts in the following sessions:

- Consigned Receipts (whwmd2550m000)
- Customer Owned Receipts (whwmd2550m100)

Items blocked for inspection are considered available for outbound advice and picking lists. Blocks for inspection are lifted when the goods to be returned are shipped.

- When shipping rejected items to be returned, remove blocks for inspection. If the **Disposition Inventory Blocked for Planning** check box in the Inventory Handling Parameters

(whinh0100m000) session is selected, decrease the quantity blocked for planning in the inventory overview sessions. If the items are project inventory, also decrease the quantity blocked for planning and the on-hand quantity in the Project Inventory (whwmd2560m000) session.

- Do not update the inventory overview sessions if items are not shipped, but moved back to the reject location from the staging location without an inventory adjustment, for example, if shipping cannot take place because transportation is unavailable.
- Process the inventory transaction according to the settings of the ownership fields on the outbound order line. For company owned returned items, generate a credit note. For customer owned or consigned items, do not generate a purchase payment order.

Note

Outbound inspections are not available for inventory disposition.

Ownership for outbound order lines of purchase return orders

The ownership of disposition inventory does not change when returned. Therefore, LN copies the ownership settings of the original purchase order (the one with which the goods were received) to the outbound order lines generated from the purchase return order, except for the **Issue Ownership** field. This is set by Warehousing. The **Internal Payment** field of the original purchase order has no impact on the ownership fields of the outbound order line. The following table shows the ownership of the original purchase order and the resulting ownership settings on the outbound order lines.

Outbound order line field for purchase returns	External payment of original purchase order		
	company owned	customer owned	consigned
Payment	Pay on Receipt	No Payment	Pay on Use
Internal Payment	Not Applicable	Not Applicable	Not Applicable
Ownership	Company Owned	Customer Owned	Consigned
Issue Strategy	Free	Restricted	Restricted
Issue-from Business Partner	Not filled	The owner	The owner
Issue Ownership	Internal ownership implemented: Company Owned Otherwise: Company Owned or Consigned	Customer Owned	Consigned

Order inspections

Order Inspections comprises of inspection orders that are used to structure the inspection of products that are purchased, produced, transferred, or sold. For products in inventory, a storage inspection order instead of a standard inspection order is used.

The standard inspection process:

1. Inspection orders are created automatically by means of predefined testing combinations, but you can also manually add, delete, or maintain inspection orders based on the origin of the order (refer to the Order Inspections (qmptc1120m000) session).
2. For each inspection order, you can create different samples with different sample sizes and different dates and time in the Inspection Order Samples (qmptc1110m000) session. Infor LN checks if the total of all samples matches the sample size.
3. Enter the test data in the Inspection Order Test Data (qmptc1115m000) session (by characteristic). The session in which you enter the test data depends on the settings in the

Quality Management Parameters (qmptc0100m000) session. When the test data is entered, the Infor LN generates the overall results defined for that specific characteristic.

4. Complete Inspection collectively by order, origin, or storage using the Complete/Process Order Inspections (qmptc1202m000) session. If an inspection order is completed, Infor LN checks if the test data is specified. If not, the inspection order cannot be completed.
5. Inspection orders can be processed by inspection order, by origin, and by storage inspection. Infor LN determines the pass and the fail pieces in the sample size. Based on this evaluation, Infor LN calculates the actual accepted and rejected quantities. These accepted and rejected quantities are compared with the acceptable quality level (AQL) specified in the Test Groups (qmptc0136m000) details session. If the percentage of accepted quantity is less than the AQL, the entire order or lot is rejected. In case of continuous sampling, the part of the order displayed in the **Frequency** field is rejected.

If an algorithm is defined for a characteristic, this algorithm is calculated during inspection. Each algorithm is calculated only when the variables (characteristics) required for that algorithm are specified.

Storage inspections

Storage inspections are quality inspections for items in inventory. If a storage inspection is generated for the selected items, these items are blocked for use and are regarded as inventory on hold.

Procedure for storage inspections

Step 1:

Generate storage inspections in the Generate Storage Inspections (qmptc2220m000) session. You can generate storage inspection orders based on item, warehouse, location, lot, business partner, and date. Infor LN uses the testing combination and standard test procedure for the default inspection data.

Step 2:

Use the Item - Storage Inspections (qmptc2120m000) session to view the storage inspections that you generate in the Generate Storage Inspections (qmptc2220m000) session.

Step 3:

Use the Storage Inspection - Inventory (qmptc2130m000) session to allocate the lot(s), the warehouse(s), and the items that must be inspected for this inspection order.

Step 4:

Use the Storage Inspections (qmptc2120m000) session to display the storage inspection orders that are created by default. In this session you can also modify storage inspection orders or create new storage inspection orders.

Step 5:

Use the Inspection Order - Lines (qmptc1101m000) session to display, modify, or create inspection order lines. The inspection order lines indicate how an item is tested.

Step 6:

Use Inspection Order - Samples (qmptc2110m000) session to create different samples with different sample sizes and different dates and times for each inspection order. Infor LN checks if the total of all the samples matches the sample size.

Step 7:

Enter the test data in the Inspection Order Test Data (qmptc1115m000) session by characteristic. When the test data is specified, Infor LN generates the overall results defined for that specific characteristic.

Step 8:

Process the inspection orders using the Complete/Process Order Inspections (qmptc1202m000) session. ERP determines the 'good' and the 'bad' pieces in the sample size. Based on this, ERP calculates the actual accepted and rejected quantities. These accepted and rejected quantities are compared with the acceptable quality level (AQL), entered in the Test Groups (qmptc0136m000) session. If the percentage of accepted quantity is less than the AQL, the entire order or lot is rejected.

Step 9:

Use the Print and Close Storage Inspections (qmptc2221m000) session to close the orders with the status processed. ERP checks for all processed storage inspections and unblocks all inventory.

Order specific test procedures

Inspection orders are used to structure the inspection of products. The orders are generated based on testing combinations. The inspection process for items with testing combination is the same.

Infor LN also allows you to define order-specific test procedure. Order-specific test procedure data is the copied testing combination (that is, standard inspection data) that you can modify and change for a specific order in a specific scenario.

Process to generate order specific test procedures

Step 1:

Specify order origins and the related orders details in the Order Specific Test Procedures (qmptc0149m000) session.

Note: To implement order-specific inspections if you select one or more Order-Specific Inspection Data check boxes in the Quality Management Parameters (qmptc0100m000) session. These parameters indicate, per origin, whether or not order-specific inspection data can be defined for a specific origin order.

Step 2:

Start the Order Specific Inspections (qmptc0150m000) session from the Specific Orders - By Origin (qmptc0149m000) session. You can change, add, or delete order-specific inspection orders in the Order Specific Inspections (qmptc0150m000) details session.

Step 3:

Start the Order Specific Inspection Lines (qmptc0151m000) session from the Order Specific Inspections (qmptc0150m000) session. You can now define the order-specific inspections lines. Each line represents a characteristic that was defined in the Test Group Characteristics (qmptc0137m000) session.

The order-specific inspection order is now generated. The rest of the inspection procedure is the same as that described from step 2 (drawing samples) in the *Order inspections* (p. 33) online manual topic.

Receipt and inspection procedures

The receipt and inspection procedures comprise the activities that you must perform in LN to receive and, if required, inspect goods that you want to store in the warehouse. Some of the activities are mandatory, and some only apply to location-controlled warehouses. You are not required to include non-mandatory activities in your warehousing procedures.

In addition, you can also specify whether an activity must be performed manually or automatically. For information on how to define warehousing procedures, see *To define warehousing procedures (p. 14)* and Automatic or manual execution of activities.

Overview

The following table provides an overview of the receipt and inspection procedures. The outer left column shows the order of the steps in the receipt and inspection procedures. The second column indicates whether a step is mandatory.

Step	Mandatory	Activity	Status/Description
1	No	Print Goods Received Note (whinh3412m100)	Planned or Open
2	Yes	Warehouse Receipts (whinh3512m000)	Create receipt: Receipt Open Confirm receipt: Received or, for non-location controlled warehouses, Put Away or To be Inspected if inspections are included in the inbound procedure.

3	Yes for location-controlled warehouses	Generate Inbound Advice (whinh3201m000)	Advised
3	No	Inbound Advice (whinh3525m000)	Advised. Maintain inbound advice
4	No	Generate Storage List (whinh3415m000)	Advised
5	No	Storage List (whinh3525m100)	Advised. Maintain storage list and put away inbound advice. If you use storage lists, you do not use the Put Away Inbound Advice (whinh3203m000) step to put away inbound advice.
6	Yes for location-controlled warehouses	Put Away Inbound Advice (whinh3203m000)	Put Away
7	No	Warehouse Inspections (whinh3122m000)	After inbound advice is put away: To be Inspected After inspection is completed: Inspected

If an optional step is not included in the receipt and inspection procedures, LN skips this step and carries out the next step defined in the warehousing procedure. The affected inbound order lines then obtain the status of that step.

If the receipt or inspection procedure is carried out for a non-location controlled warehouse, LN skips the steps that are not applicable for non-location controlled warehouses. The affected inbound order lines then obtain the status of the next applicable step.

LN does not use the following steps for non-location controlled warehouses:

- Generate Inbound Advice (whinh3201m000)
- Inbound Advice (whinh3525m000)
- Generate Storage List (whinh3415m000)
- Storage List (whinh3525m100)
- Put Away Inbound Advice (whinh3203m000)

The following are some of the scenarios for receipt and inspection procedures:

- Full scenario

- Only mandatory steps including inspection
- Non-location controlled including inspections
- Full scenario without inspections

Receipt and inspection procedures - in detail

The receipt and inspection procedures comprise the activities that you must perform in LN to receive and, if required, inspect goods that you want to store in the warehouse. This topic describes all steps, also called activities, of the inbound and inspection procedures and shows how you can perform these steps.

Some of the activities are mandatory, and some only apply to location-controlled warehouses. You are not required to include non-mandatory activities in your warehousing procedures. In addition, you can specify whether an activity must be performed manually or automatically. For information on how to define warehousing procedures, see *To define warehousing procedures (p. 14)* and Automatic or manual execution of activities.

The receipt and inspection procedures include the following mandatory activities:

- Warehouse Receipts (whinh3512m000)
- Generate Inbound Advice (whinh3201m000)
- Put Away Inbound Advice (whinh3203m000)

Note

Note that of the mandatory activities, Generate Inbound Advice (whinh3201m000) and Put Away Inbound Advice (whinh3203m000) are only available for location-controlled warehouses. This also applies to the optional activities Generate Storage List (whinh3415m000) and Storage List (whinh3525m100).

If the warehouse is not location-controlled, LN skips these activities and automatically stores the goods in the warehouse after the receipt is confirmed. The status of the inbound order line then changes from **Receipt Open** to **Put Away**. For further details, see steps 2 and 7. If an inspection procedure is included in the warehousing procedure, the status of the inbound order line changes from **Receipt Open** to **To be Inspected**, which is described in step 7.

The receipt and inspection procedures include the following steps:

Step 1: Print goods received note (optional)

The first step of the receipt procedure is to print a goods received note for the inbound order lines that you want to receive. The initial status of an inbound order line is either **Planned** or **Open**. For more information, refer to Print Goods Received Note (whinh3412m100) and Planned status for Warehousing order lines.

Step 2: Receive goods

The **Receipt** activity is a mandatory step of the inbound procedure.

When inbound goods arrive at the warehouse, the goods are counted and the receipt of the goods is confirmed. Many warehouses use scanning devices to receive goods, in which case they scan the serial numbers or the labels of the handling units of the goods.

To receive goods in LN, you must create a receipt record and link the inbound-order lines, advance shipment notices, or handling units, which list the goods, to the receipt record. As a result, LN creates receipt lines for the linked inbound order lines, handling units, or ASN lines. For more information, refer to *How to receive goods* (p. 15).

If the ownership for the received goods is other than company owned, LN creates an ownership record when a receipt is linked to an inbound order line. If the ownership is consigned, LN creates a consumption record in the Consigned Receipts (whwmd2550m000) session. If the ownership is customer owned, LN generates a consumption record in the Customer Owned Receipts (whwmd2550m100) session only when the consigned inventory is used/ issued from a warehouse. For more information, refer to Inventory ownership in Warehouse Management.

You can create receipt records in the Warehouse Receipts (whinh3512m000) session.

Alternatively, you can create a receipt for inbound order lines as follows:

1. In the Inbound Order Lines (whinh2110m000) session or the Inbound Line Status Overview (whinh2119m000) session, select the appropriate menu.
2. On the appropriate menu, click **Receive**.

After you create a receipt record for an inbound order line, the status of the inbound order line changes to **Receipt Open**.

After you create a receipt and link order lines, handling units, or ASNs, you must confirm the receipt. After the receipt is confirmed, the status of the inbound order line changes to **Received** and LN creates an inventory record for the received items.

Note that for non-location controlled warehouses, when you confirm the receipt for an inbound order line, the status changes from **Receipt Open** to **Put Away**. The reason is that for non location controlled warehouses, the inbound advise and put away activities are not available. After confirming the receipt, the goods are automatically put away. If an inspection procedure is included in the warehousing procedure, the status of the inbound order line changes from **Receipt Open** to **To be Inspected**, which is described in step 7.

To confirm a receipt, in the Warehouse Receipts (whinh3512m000) session; go to appropriate menu --> Confirm --> **Receipt**. For more information, refer to *How to receive goods* (p. 15).

If this activity is performed automatically, LN both creates and confirms the receipt record.

Step 3: Advise goods

Inbound advice comprise instructions to move received and/or inspected goods to particular storage locations in a warehouse.

After a receipt is confirmed, you can generate inbound advice that show the pick or bulk locations to which the goods must be moved.

If the warehouse procedure defined for the inbound order line includes an inspection procedure, the inbound advice shows the inspection location to which the goods must be moved. For more information, refer to the description of the Inspect Goods, step 7 in this topic.

To generate inbound advice, in the Generate Inbound Advice (whinh3201m000) session, select the inbound order lines that list the goods that you want to advise and click **Advise**. You can maintain inbound advice data in the Inbound Advice (whinh3525m000) session. Alternatively, you can generate inbound advice for individual order lines in the Inbound Line Status Overview (whinh2119m000) session. For more information, refer to *To generate and put away inbound advice (p. 42)*.

After the inbound advice is generated, the status of the inbound order lines that list the goods selected in the outbound advice changes to **Advised**.

Step 4: Generate storage list

A storage list is a document that shows the locations where received or inspected goods must be stored. It provides more detailed instructions than the inbound advice. You can generate storage lists after the inbound advice is generated. The storage list activity is only available for location-controlled warehouses. After you generate a storage list for an inbound order line, the status of the order line remains **Advised**.

You can generate storage lists in the Generate Storage List (whinh3415m000) session.

Alternatively, you can generate storage lists for individual inbound order lines in the Inbound Line Status Overview (whinh2119m000) session.

Step 5: Storage list

In the Storage List (whinh3525m100) session, you can maintain storage list data and put away the goods listed on the storage list. If you put away the goods in the Storage List (whinh3525m100) session, you do not have to use the Put Away Inbound Advice (whinh3203m000) session. After you put away the goods listed on a storage list, the status of the related order lines changes from **Advised** to **Put Away**.

If the warehouse procedure defined for the inbound order line includes an inspection procedure, LN creates an inspection record after the inbound advice is put away, and the inbound order line obtains the **To be Inspected** status.

Step 6: Put away goods

After the receipt is confirmed and the inbound advice is generated for the inbound order line or the handling unit, you can store the goods in the warehouse.

You can put away goods using the following sessions:

- Put Away Inbound Advice (whinh3203m000)
- Inbound Advice (whinh3525m000)
- Inbound Line Status Overview (whinh2119m000)
- Storage List (whinh3525m100)

After the inbound order line is put away, the order line obtains the **Put Away** status. For more information, refer to *To generate and put away inbound advice (p. 42)*.

If the warehouse procedure defined for the inbound order line includes an inspection procedure, LN creates an inspection record after the inbound advice is put away, and the inbound order line obtains the **To be Inspected** status.

Step 7: Inspect inbound goods

The inbound inspection procedure is one of the main warehousing procedures in LN. The inspection procedure is optional, because not every warehouse, supplier, and item requires inspection.

You can also perform inspections for outbound goods. For further information on outbound inspections, see *The outbound procedure*.

You can move inbound goods to an inspection location after the receipt is confirmed and the inbound advice is put away to an inspection location as described in the previous steps. Inbound order lines that are put away to the inspection location obtain the **To be Inspected** status. At the inspection location, you can approve, reject, or destroy goods. You can maintain inspection data in the Warehouse Inspections (whinh3122m000) session. For non location-controlled warehouses, the status of an inbound order line changes to **To be Inspected** after the receipt is confirmed.

To enhance efficiency, you can consider setting the inbound advice to the inspection location to automatic.

For the approved quantity of an inspected order line, you must again generate the inbound advice and put away the inspected goods if the warehouse is location-controlled. To generate and put away inbound advice for inspected goods, proceed in the same way as described in the previous steps. The status for inbound order lines for which inbound advice is generated after inspection is **Advised**. The status for inbound order lines that are put away after inspection is **Put Away**. For more information, refer to *Approvals and inspections* (p. 27).

For non-location controlled warehouses, the status of an inbound order line changes to **Put Away** after the inspection is completed. The reason being the Generate Inbound Advice (whinh3201m000), Generate Storage List (whinh3415m000), Storage List (whinh3525m100), and the Put Away Inbound Advice (whinh3203m000) activities are unavailable for warehouses without locations.

To generate and put away inbound advice

Inbound advice are instructions to move received items into a warehouse. Therefore, an individual inbound advice line might read as follows: Take 10 pieces of item A from location Receipt 3 and put them in location Bulk 5.

Inbound advice is normally generated according to the warehousing procedure defined for the warehousing order lines related to the receipt lines, inspection lines, or handling units for which inbound advice must be created, but you can also manually create inbound advice in the Inbound Advice (whinh3525m000) session.

Note that for non-location controlled warehouses, LN skips the inbound advice step.

Generate inbound advice

When inbound advice is generated or entered, no inventory transactions have yet taken place. If the items are physically taken from one location and put away in the new location, LN updates inventory. The inventory is updated by means of the Put away command, which is discussed later in this topic.

You can generate inbound advice in one of the following ways:

- If Generate Inbound Advice (whinh3201m000) is not a step in the receipt procedure, inbound advice is generated as soon as you confirm a receipt. If Generate Inbound Advice (whinh3201m000) is not a step in the inspection procedure, inbound advice is generated as soon as an inspection line is approved.
- To generate inbound advice for any confirmed receipt, select the **Generate Advice** option from the appropriate menu in the Warehouse Receipts (whinh3512m000) session.
- You can generate inbound advice for a range of orders in the Generate Inbound Advice (whinh3201m000) session.

When you create an inbound advice line, the following changes take place:

- The allocated inventory level of the source location increases.
- The on-order quantity of the destination location increases.

Run numbers

Runs are a useful way to group inbound advice lines. Instead of putting away or removing individual advice lines, you can specify a run number and process the advice lines that you allocate to that run number.

Detailed report

Generating inbound advice is a process that draws heavily on the system's capacity. Therefore, LN enables you to choose between the following types of reports:

- The standard report, which keeps network traffic low and transaction speeds high.
- The detailed report, which is a slower, more detailed query with greater feedback as to the chosen location.

Maintain inbound advice

You can change the destination location and/or the quantity on any inbound advice line. You can also insert new advice lines, if required.

Put away inbound advice

The following methods are available to put away inbound advice:

- You can use the **Put Away** command in the Inbound Advice (whinh3525m000) session to put away an individual advice line.
- In the Put Away Inbound Advice (whinh3203m000) session, you can put away a range of advice lines.
- If the advice line is associated with a storage list, confirming that storage list puts away the advice line. You can view and put away the storage list in the Storage List (whinh3525m100) session.

If an inbound advice line is put away, LN reflects the physical movement of items, which results in the following changes:

- The inventory on hand at the source location is decreased and the available capacity of the source location is increased.
- The inventory on hand at the destination location is increased and the available capacity is decreased.
- The allocated inventory at the source location is decreased.
- The inventory on-order at the destination location is decreased.

Note

For non-location controlled warehouses, LN automatically puts away goods after their receipt is confirmed. For more information, refer to *Receipt and inspection procedures* (p. 37).

Storage lists

The bulk/ pick (destination) locations listed on inbound advice can be anywhere in the warehouse, which might result in an inefficient put away sequence. The storage list is used to make this sequence more efficient by, for example, including all items that must go to a specific location on one list. By confirming a storage list, you put away each advice line associated with the storage list. You can put away storage lists in the Storage List (whinh3525m100) session.

Peg distribution in the inbound and inspection processes

Receiving project pegged goods into a warehouse results in inventory transactions that are based on the underlying peg distribution of the related receipt line.

Inbound and Pegging

This results in an update of the pegged inventory levels in the Project Pegged Inventory (whwmd2560m000) session. The planned quantity of the inbound order line is updated in the Planned Inventory Transactions (whinp1500m000) session, which also includes the peg data. Planned inventory transactions are also generated for each peg.

If the receipt line is marked for inspection, the received quantity is blocked. Depending on the parameter settings, the quantity can also be blocked for usage by Enterprise Planning. Any quantity, rejected (or destroyed) during receipt inspection are assigned to the pegs having the latest required date to make sure that the approved items are assigned as much as possible to the pegs with the earliest required date in order to meet the demand in time.

Project Warehouses

For a ship-from or ship-to warehouse that is a Project or a Project-WIP warehouse; no inbound/ outbound order line peg distribution is created. In that case, the project fields on the inbound/ outbound order lines are used. When however, an inbound/ outbound order line is created for a 'Project Pegged' item related to a Normal warehouse, a peg distribution is applicable and the project fields on the inbound/ outbound order lines are disabled.

Inbound Order Line Peg Distribution

For an inbound order line, the peg distribution data can only be viewed and not maintained. In case of manual transfer orders, the peg distribution can only be maintained (manually) on the outbound order

line. When an outbound transfer line is saved after the peg distribution is modified, the inbound transfer order line peg distribution changes accordingly.

Cost and Service Items

For order lines with a cost or service item, also a peg distribution can exist, but assigning the received quantities of these item types to the peg lines is always performed pro-rata. This peg distribution data is only essential for proper cost allocation to projects/ pegs and has no logistic purpose as these items are non-physical entities. When ordering zero pieces of a certain cost/ service item, also a peg distribution data can be created, consisting of only one peg line.

Warehouse Receipts

- **Receipt Line Peg Distribution**

When confirming a receipt line, LN creates peg distribution under the receipt line. The sequence of assigning received items to pegs is based on the earliest required dates and required quantities retrieved from Enterprise Planning (EP).

In case an inbound line contains multiple pegs and the received quantity deviates from the ordered quantity, the received quantity must be apportioned to the peg distribution lines according to the priority determined by the 'Earliest Required Date' that is defined in Enterprise Planning (EP). The peg distribution lines are generated when the receipt is confirmed.

Sometimes, the order quantity of the order exceeds the total required quantity of the item, resulting in an excess quantity. The excess is determined in Enterprise Planning (EP), in which case the distribution lines have no demand order reference and an empty required date. Any excess on top of the required quantity (not exceeding the ordered quantity) is assigned to the pegs in peg line sequence. Any excess that is received on top of the ordered quantity is distributed to the peg lines proportionally based on the ratio of ordered quantities.

- **Update Planned Inventory Transactions / Inventory Levels**

When confirming a receipt line, the Planned Inventory Transactions are updated, based on the received quantities of the corresponding receipt line peg distribution. So, the planned inventory transactions are recorded on project peg level.

When confirming a receipt line, the Inventory on Hand is increased in the Warehouse - Item Inventory (whwmd2515m000) session. Similarly, the Inventory on Hand must be increased in the Project Pegged Inventory (whwmd2560m000) session, based on the received quantities of the corresponding receipt line peg distribution.

- **Assigning Received Quantities to Project Pegs**

In case of a full, partial or over receipt on an expected inbound order line containing multiple peg lines, LN decides the pegs to which the received quantity is assigned, based on the following sequence:

- a. The pegs having the earliest required date are received first, until all required quantities are fulfilled.

- b. The pegs having unfulfilled ordered quantities (and no required quantities anymore) are received in sequence of peg line.
- c. Any excess on top of the ordered quantity is assigned to the pegs proportionally.

When the full order line quantity is received on the linked receipt line, for each order line peg a receipt line is created and the total of the received quantities per peg line is equal to the ordered quantity.

- **Back Orders**

For a confirmed receipt line, if the received quantity is less than the expected quantity, the difference must be resolved in Purchase Control by processing the created back order (if allowed). This back order is received on another inbound line with a peg line distribution for the pegs that are not fully received.

When the back order line is received and confirmed, a receipt line peg distribution is created for the remaining pegs received.

- **Receipt Corrections**

You can use the Receipt Correction (whinh3121s000) session, to change the confirmed received quantity. Increasing the already received quantity leads to positive receipt correction. The additional received quantity is assigned to the pegs in the same way as the initial receipt.

- a. The pegs having the earliest required date are received first.
 - b. The pegs having unfulfilled ordered quantities are received in sequence of peg line.
 - c. Any excess on top of the ordered quantity is assigned to the pegs proportionally.
- Decreasing the already received quantity leads to negative receipt correction.

When the received quantity is decreased, the change in received quantity is distributed across the received pegs in the following way:

- a. Any excess on top of the ordered quantity is decreased proportionally.
- b. The received excess on top of the required quantity, but less than the ordered quantity is decreased in sequence of the peg line.
- c. Any remaining received quantity is decreased in the sequence of the latest required date.

Inbound Procedure - Inspection

The Warehouse Inspections (whinh3122m000) session does not have an own line peg distribution. Registration of inspected/ rejected quantities takes place in the peg distribution available under the receipt lines which roll up into the inbound order line peg distribution.

Generally, inventory subject to warehouse inspections remains blocked. Similarly, the Project Pegged Inventory (whwmd2560m000) to be inspected remains blocked. After processing the inspection, the planned inventory transactions and the inventory levels are updated accordingly, by peg level.

Approved quantities are assigned first to peg lines having the earliest required date. Rejected/destroyed quantities are assigned first to the peg lines having the latest required dates. In case of excess quantities, the excess must be utilized first. The rejected/ destroyed quantities are distributed based on the actual received quantities of the receipt line (not on the total values of the related inbound order line). The updated receipt line peg information is rolled up to the level of the inbound line distribution.

- **No Handling of Rejected Goods**
If the **Handle Rejected Goods** check box is not selected in the Warehouses (whwmd2500m000) session, rejected goods become supplier owned and are not added to the inventory, which means the costs must be removed from the project pegs.
- **Handling Rejected Goods (Inventory Disposition = No)**
In this scenario, the warehouse parameter **Handle Rejected Goods** is selected and **Inventory Disposition** check box is not selected in the Inventory Handling Parameters (whinh0100m000) session.. Rejected goods become supplier owned, which means the costs must be removed from the project pegs. Rejected Inventory (whwmd2570m000) records are created for rejected quantities on a purchase order (or purchase schedule). The Receipt Line Peg Distribution (whinh3528m000) session can be started from the Rejected Inventory (whwmd2570m000) but the field **In Rejected Inventory** in the Receipt Line Peg Distribution (whinh3528m000) session is no longer visible because the peg details of the rejected inventory no longer exist, so that the rejected items become anonymous (unpegged) inventory. The rejected inventory can be accepted, destroyed or returned from the Rejected Inventory (whwmd2570m000) session.
- **Handling Rejected Goods (Inventory Disposition = Yes)**
In this scenario, the warehouse parameter **Handle Rejected Goods** check box and the **Inventory Disposition** check box in the Inventory Handling Parameters (whinh0100m000) session are selected. The field **In Rejected Inventory** in the Receipt Line Peg Distribution (whinh3528m000) session is populated in the pegs, because the peg details still exist for the rejected items and the items do not become anonymous (unpegged) inventory. The pegs are updated while handling the rejected inventory. The quantity **In Rejected Inventory** must be decreased for each accepted, destroyed (scrapped) or returned inventory.

Outbound Procedure - Inspections

The Warehouse Inspections (whinh3122m000) session does not have own line peg distribution. There is also no specific peg distribution related to the outbound advice. Inspected/ rejected quantities are registered in the Outbound Order Line Peg Distribution (whinh2190m000) session.

Generally, inventory scheduled for outbound inspections remains blocked. Similarly, the Project Pegged Inventory (whwmd2560m000) to be inspected remains blocked. After processing the inspection, the planned inventory transactions and the inventory levels are updated accordingly, by peg level.

Update Outbound Order Line Pegs

The **To be Inspected Quantity** on the Outbound Order Line Peg Distribution (whinh2190m000) session, reflects the advised peg quantity that is already released and is subject to inspection.

The following conditions are applicable to handle the outbound order line pegs during warehouse inspections:

- For each released outbound advice, an inspection line is created. At this point, the **To be Inspected Quantity** is defined and apportioned to the pegs in sequence of earliest required date.

- When the advised quantity of the earliest peg is fully assigned as **To be Inspected Quantity**, the remainder of the released quantity is assigned to the **To be Inspected Quantity** of the next peg with the earliest required date and so on.
- Any approved quantities are assigned to the pegs in sequence of the earliest required date.
- Any rejected quantities are assigned to the pegs in sequence of latest required date. But in case of over delivery (Advised quantity > Ordered Quantity), the excess must be consumed first in sequence of earliest required date.
- The **To be Inspected Quantity** of the pegs is blocked for inspection.
- While processing an inspection record, any approved or rejected quantity is apportioned only to those pegs that have a **To be Inspected Quantity**. This **To be Inspected Quantity** is consumed by the approved and rejected quantities assigned to the peg. Effectively, the blocked quantity is decreased for the quantity processed.
