About this guide

This document describes the process of WAR generation, deployment and re-deployment on Tomcat and WebSphere for applications like Net-Link and IDFIONAPI. Also, on how to secure Net-Link and IDFIONAPI using TLS.

Revision History

Version	Date	Author	Comments
0.1	14/Jun/2017	Michael Dillon	Initial Draft
0.2	11/Apr/2019	Singaravizhiyan R	Added Building WAR file and Workspace Net-Link URL configuration

Contacting Infor

If you have questions about Infor products, go to Infor Concierge at <https://conciierge.infor.com/> and create a support incident.

The latest documentation is available from docs.infor.com or from the Infor Support Portal. To access documentation on the Infor Support Portal, select **Search > Browse Documentation**. We recommend that you check this portal periodically for updated documentation.

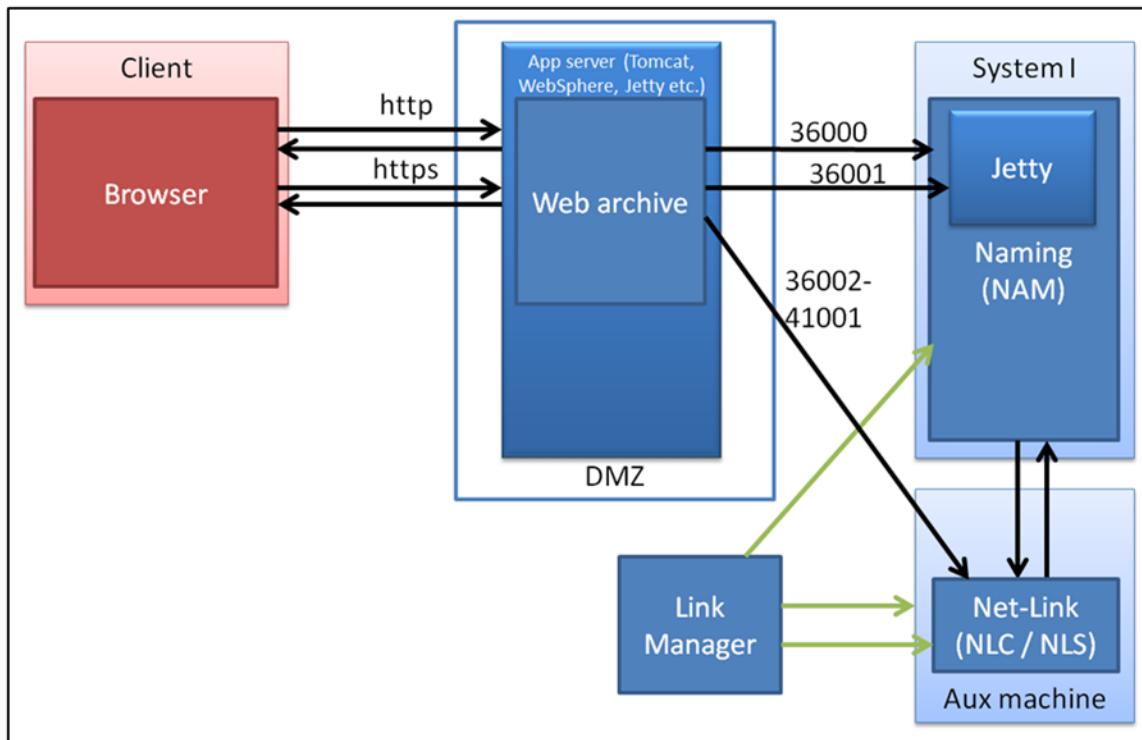

If you have comments about Infor documentation, contact documentation@infor.com.

Chapter 1 Net-Link WAR file Deployment Overview

The standard installation process involves accessing the Net-Link through a URL to the IBMi due to which users are confined to a secure network. However, in some circumstances it is necessary to provide access to the users outside of the network. Although the platform is secure, and can be protected via firewall settings, connecting directly to IBMi from the web is not recommended.

Therefore, it is necessary to expose the Net-Link web server components to the web.

An example topology of the IDF components used for Net-Link in a container deployment scenario: The default ports used by IDF for http and https are typically 80 and 443 respectively.

The web components of Net-Link runs in a Servlet container. Examples of such a container are Apache Tomcat and IBM WebSphere. The components are packaged into a Web Archive (WAR)file.

Note: The container used for System i Workspace can also be used. This document explains how to obtain the WAR file, and to deploy it to these servers.

Fully Qualified Domain Names

For a Microsoft Windows deployment, we recommend that the Windows Server has a Fully Qualified Domain Name (FQDN) that can be used to address the Windows Server, both externally and internally (i.e. the Windows Server knows itself by this FQDN) within your enterprise.

For either a Microsoft Windows or IBMi deployment, we recommend that the IBMi server also has a FQDN that it can be used to address the Windows Server, both externally and internally (i.e. the IBMi knows itself by this FQDN) within your enterprise.

It is important to have FQDNs in place before you install System i Workspace, otherwise, the URL paths, SSL configuration and other settings created during the installation may be incorrect and cause failures when trying to access or use System i Workspace.

Chapter 2 Net-Link WAR file Generation and Deployment

The WAR file contains configuration details to communicate with the IBMi. Therefore, the file cannot be shipped with the IDF as a component. The file contains components that can change during the build of IDF. Therefore, it is important to refresh the WAR file regularly when a new build is applied to the global IDF environment.

Net-Link WAR file generation in XA

Below sections explain the different ways to generate WAR files in XA.

Generate WAR file in XA R92

The current WAR file can be obtained by navigating to the URL <http://{server}:{port}/NetLink/NetLink.war>.

where {server}, is the name of the IBMi which hosts IDF, and {port} is the port used for access to IDF components over HTTP.

(For example: <http://usall02.infor.com:36001/NetLink/NetLink.war>)

Caution: The URL is like the link used to access Net-Link.

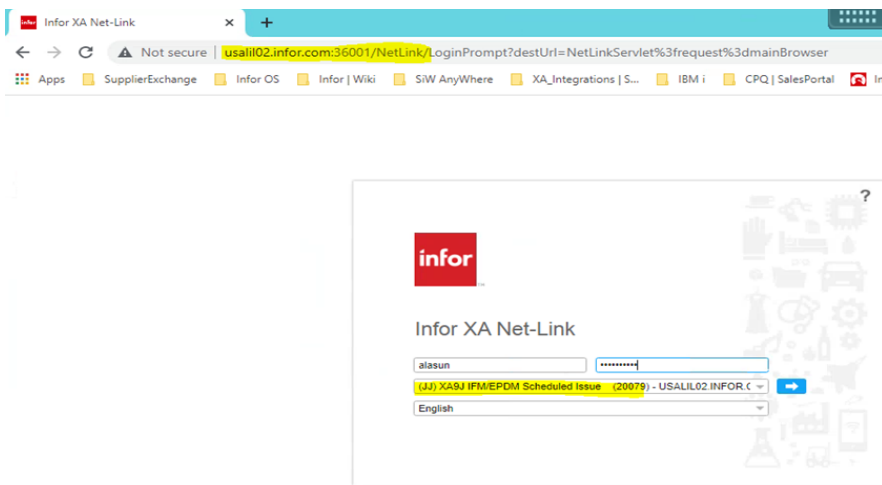

Note:

- An alternative mechanism to obtain the WAR file has been created in XA R10 release. Previously, the war file was generated and downloaded from the server via the URL, as discussed above.
- This still works but as the war file is generated from global the contents are therefore at the build level that is current for the global environment. A new URL has been created that generates it from the environment (and at the build level of the environment)

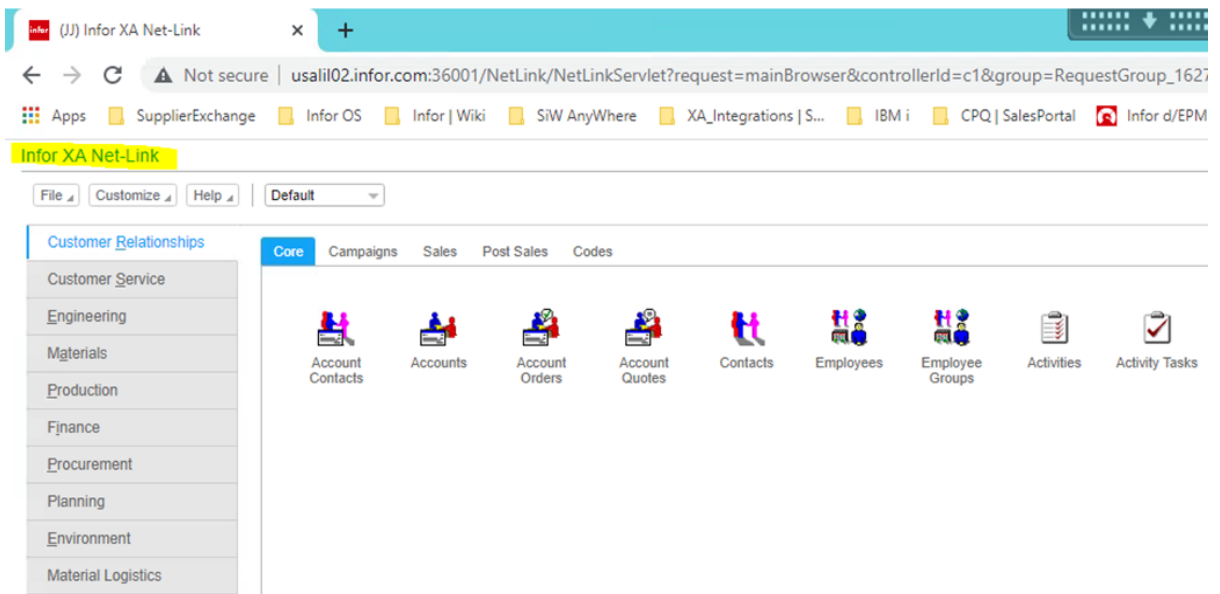

<http://{server}:{port}/NetLink/WebArchive>.

Generate WAR file in XA R10

- 1 The user must be signed into Net-Link for the environment that has the correct build.
- 2 Navigate to <http://{server}:{port}/NetLink> where {server}, is the name of the IBMi which hosts IDF, and {port} is the port used for access to IDF components over HTTP.
- 3 The Net-Link login prompt should be shown below, then Sign into Net-Link for the correct environment using respective IBMi userID.

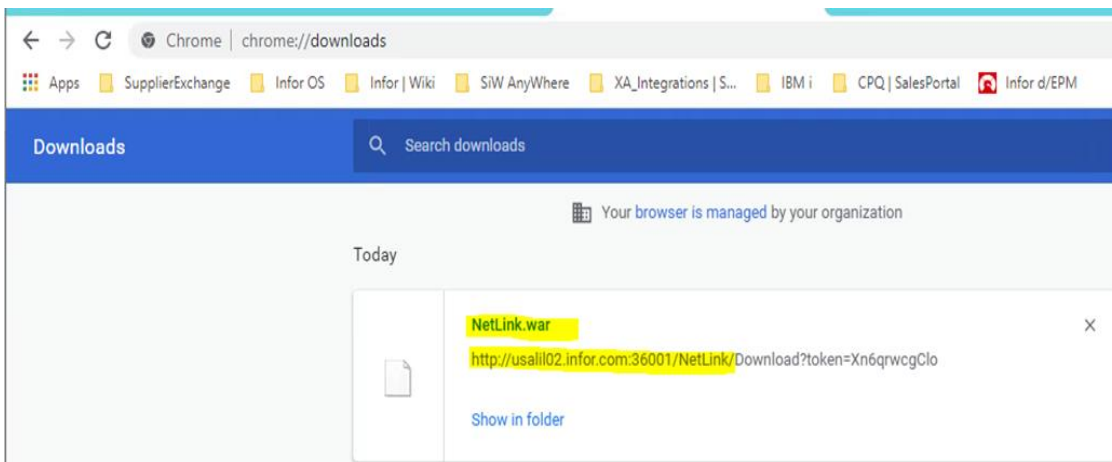

- 4 The Main Browser should display as below.

- 5 Either in a new tab (the browser session is shared between tabs), or in the current tab, navigate to <http://{server}:{port}/NetLink/WebArchive> where {server}, is the name of the IBMi which hosts IDF, and {port} is the port used for access to IDF components over HTTP.

- 6 The NetLink.war file should be generated and downloaded.

Building WAR file

The Net-Link WAR file generation code is present only in Version 9.2 and 10. The **Exception Encountered** error message is displayed a previous version, the WAR file must be built manually.

NetLink.war

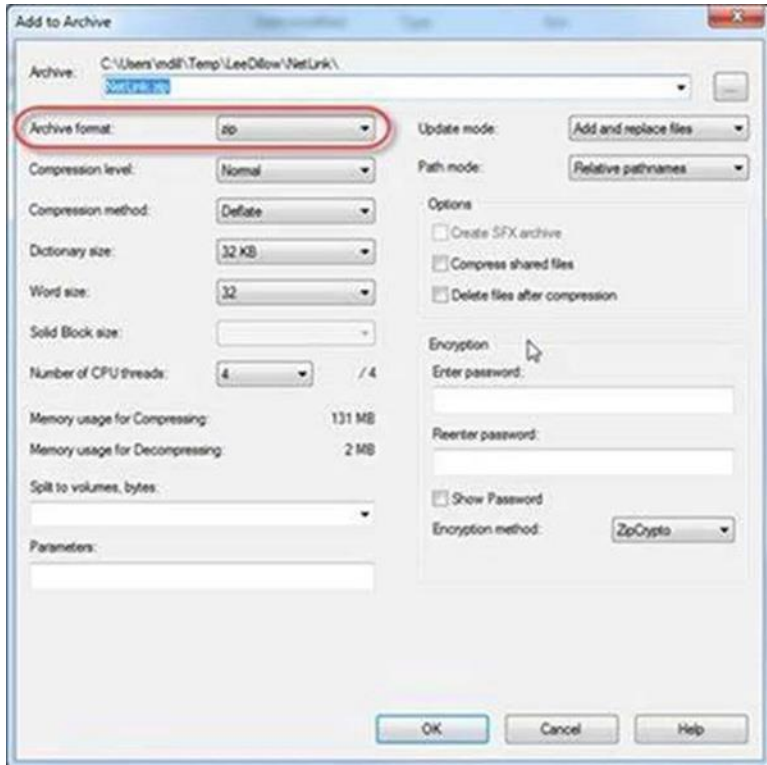

To build the file manually:

- 1 Extract the contents of the NetLink.war file to a new location using 7z.
- 2 Edit the WEB-INF/web.xml file and change all occurrences of nlbaiq05.infor.com (or the lower-case equivalent) with the Fully Qualified Domain Name (FQDN) of your iSeries.

web.xml

- 3 Compress the contents to a new WAR file (named **NetLink.war**), ensuring that the structure matches that of the originally attached WAR file. Set the **Archive Format** field to zip.

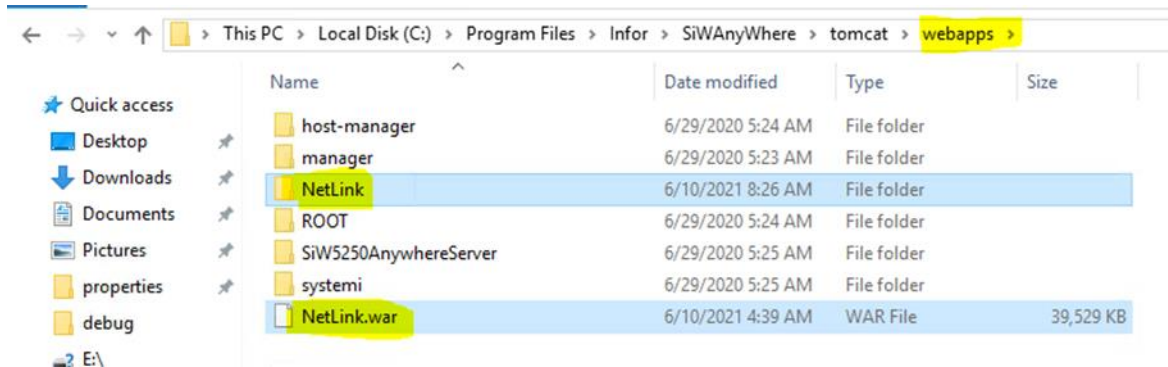

Net-Link WAR file deployment to Tomcat

Follow the steps below to deploy the Net-Link WAR to tomcat for SiWA Windows installation.

- 1 Go to Windows server having SiWA Windows(tomcat) running. Go to windows services and stop the SiWA specific service.

- 2 Go to SiWA installation folder and webapps folder. Paste the NetLink.war file and restart the SiWA service. Tomcat will unzip the war file and deploy it automatically.

- 3 Configure the Net-Link URL in SiWA Administrator by following the steps in “**Appendix C Secured Net-Link URL configuration in SiWA Administrator**”.

Net-Link WAR file deployment on WebSphere

If you are using WebSphere with version 8.5, please follow the steps below in **WebSphere (Version 8.5)** section. Else, if you are using WebSphere version 9.x and above, please follow the below steps in **WebSphere (Version 9.x)** section.

WebSphere (version 8.5)

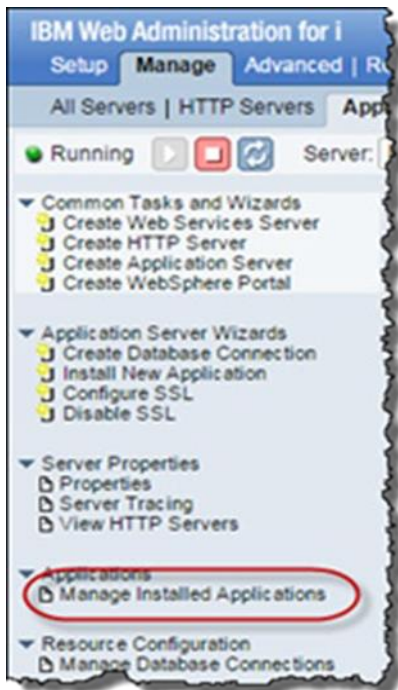

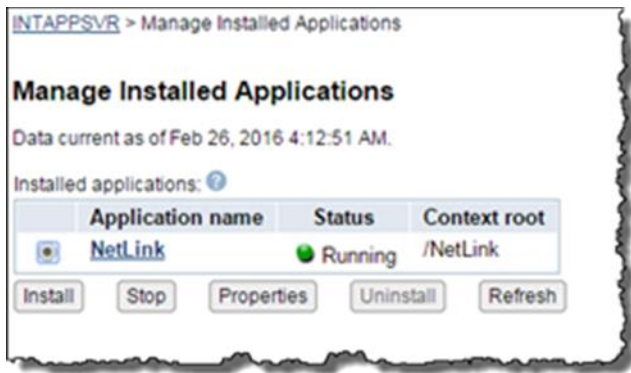

For deployment of WAR file using WebSphere, execute these steps:

- 1 Copy the WAR file to a location on the IFS of the iSeries which is preferably a ‘scratch’ folder. However, the location can also be in the root.

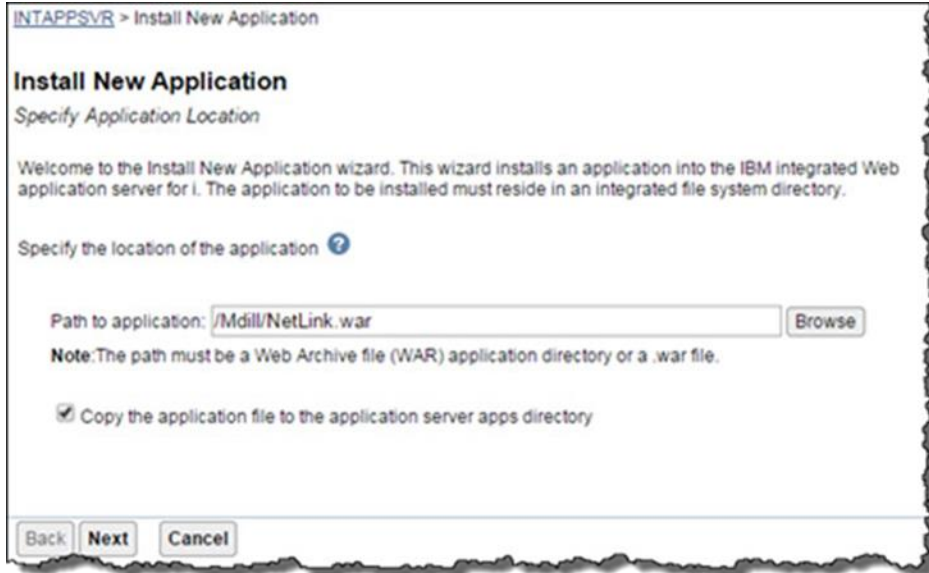

Note: If using the WebSphere instance of Systemi Workspace, make a copy of the plugin configuration (see the Systemi Workspace instructions for details).
- 2 Open the HTTP Administration console (<http://{hostName}:2001/HTTPAdmin>), and log in with *SECADM authority.
- 3 Select the Manage, and Application Servers tabs.

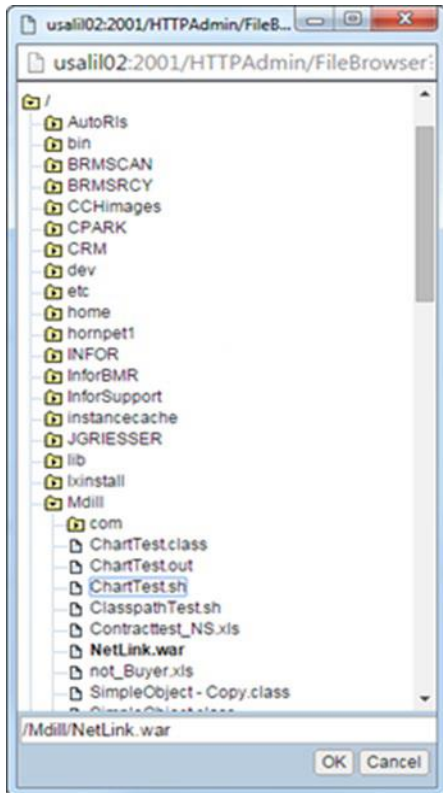

- 4 Specify a server instance in the Server field or select the instance used by Systemi Workspace.
- 5 Select Manage > Manage Installed Applications.
- 6 Click **Install** to add Net-Link as a new application.

- Specify the location of the WAR file (the location specified in Step 1) in the **Path to application** field.

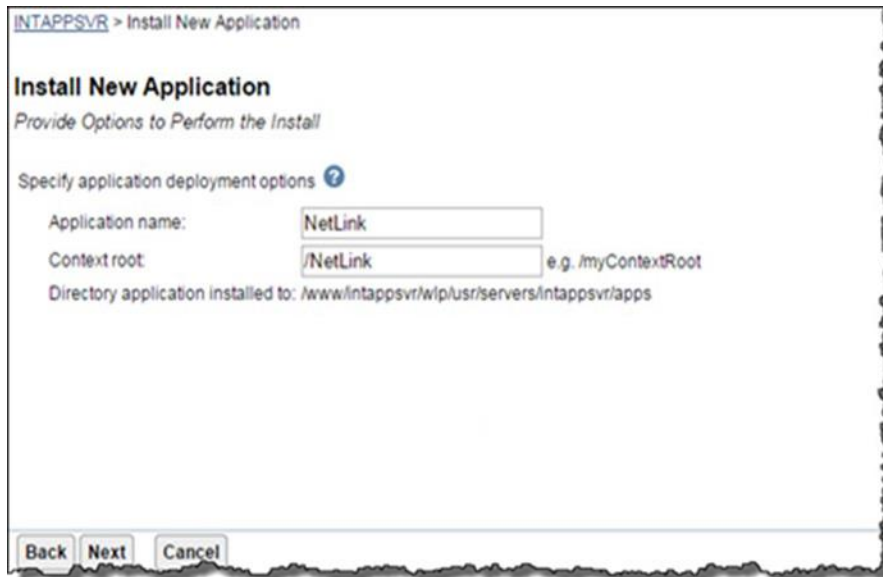

Note: You can also use the Browse option to select the **File**.

Note: Make sure that the location of the WAR file is correct.

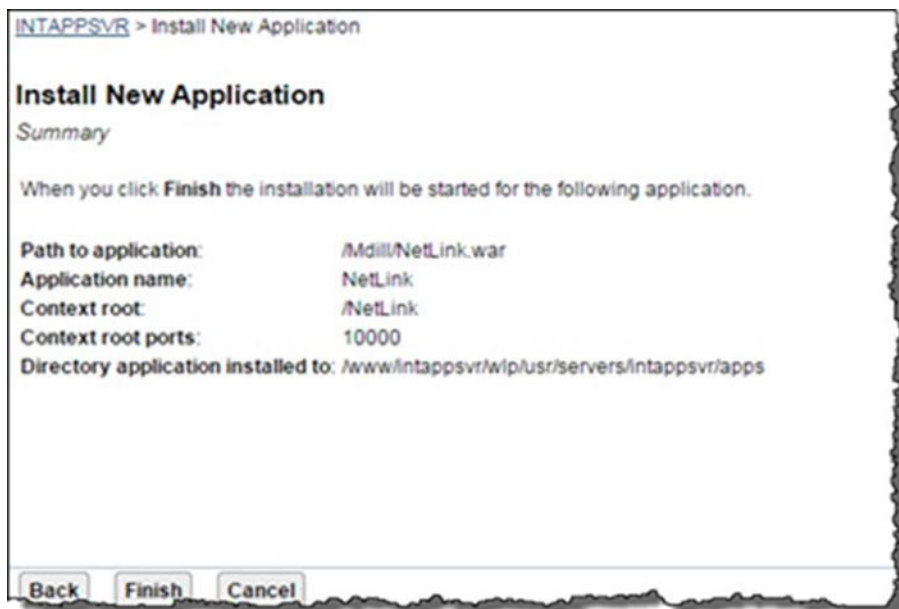

8 Select the Copy the application file... check box.

9 Click Next. The Provide Options to perform the Install window is displayed.

10 Accept the default values for the **Application name** and **Context root**.

11 Click **Next**. The **Summary** window is displayed.

12 Review the content on the **Summary** window.

13 Click **Finish**.

Note: It is assumed that System i Workspace is already deployed to WebSphere.

WebSphere (version 9.x)

The deployment process utilizes the WebSphere Wizard function to create a Net-Link Application and associated HTTP server.

Check that you have the following subsystem running, and that all ADMIN jobs are running within the subsystem:

WRKSBSJOB QHTTSPVR

If the subsystem is not active, issue the following OS400 command:

STRTCPSVR SERVER(*HTTP) HTTPSVR(*ADMIN)

For deployment of WAR file using WebSphere, execute these steps:

- 1 Copy the WAR file to a location on the IFS of the iSeries which is preferably a 'scratch' folder. However, the location can also be in the root.
- 2 Open the HTTP Administration console (<http://<hostName>:2001/HTTPAdmin>), and log in with *SECADM authority.
- 3 Select the **Manage**, and **All Servers** tab.
- 4 Select Create Application Server and Click Next.

Server	Version	Status	Address:Port	Description
Admin1	V8.5 (int app svr)	Running	*:2002	
Admin2	V8.5 (int app svr)	Running	*:2004,2005	
Admin3	V8.5 (int app svr)	Running	*:2006	
Admin4	V8.5 (int app svr)	Running	*:2008	
Admin5	V8.5 (int app svr)	Running	*:2011	
default/server1	V8.5.5.7 Express	Stopped	*:2809,5060,5061,8880,9043,9060,9080,9443	

- 5 Select V9.0.0.xx Base and Click **Next**.

6 Enter appropriate Application server name and Server description and Click Next.

Suggested values

Application server name: NLAPPSVR

Server description: Net-Link Application Server

7 Click Next.

8 Select Create a new HTTP server (powered by Apache) and Click Next.

9 Enter appropriate HTTP server name and HTTP server description and Click Next.

Suggested values

Application server name: NLWEBSVR

HTTP server description: Net-Link Web server

IP address: All IP address

Port: 36001

Note: The port should be the same as that you have used in the **WAR file generation** section.

Note: If you receive the below Warning that the port is already configured by another application is displayed. Enter a new port, which hasn't been configured by another application, please make a note of the new port and click *Next* to continue the wizard using the port (36001), which is already been configured by another application. You will be asked to change the port (36001) to the new port by following "**Appendix A Reset Port on Warning**" at the end of this wizard.

10 Accept the default **First port in range:** default values and Click **Next**.

11 Deselect Default Applications and Click Next.

12 Select Do not configure Identity Tokens and Click Next.

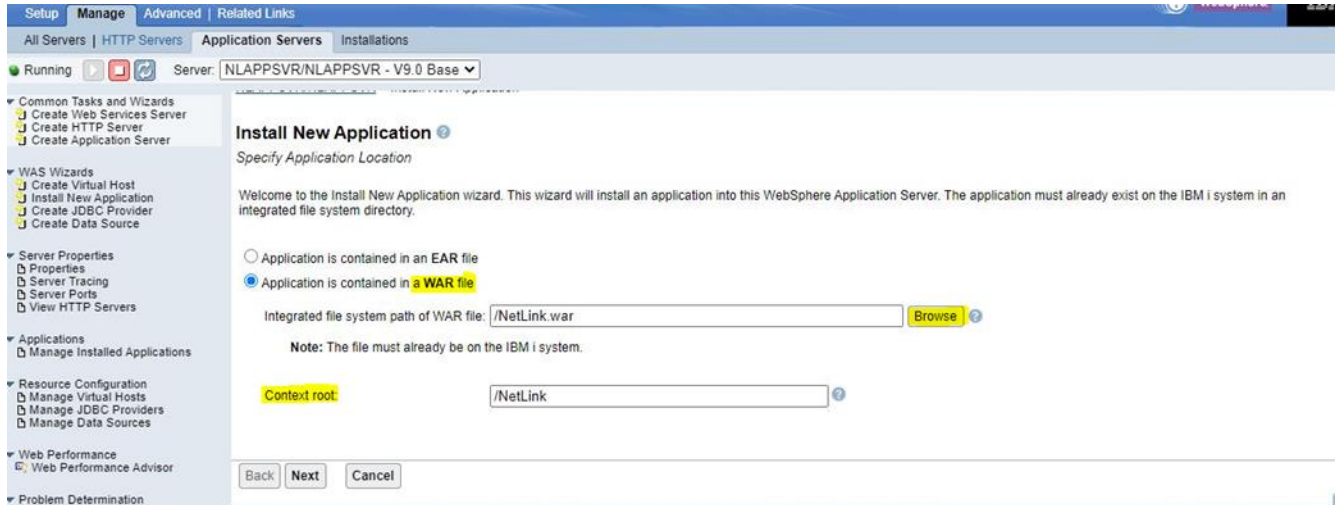

13 Review the Summary and Click **Finish**.

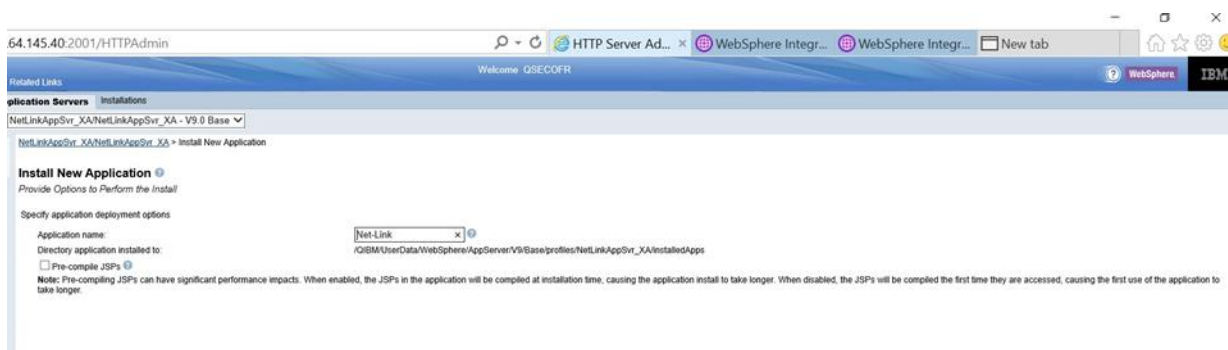

14 Select **Install New Application** from the *WAS Wizards* menu.

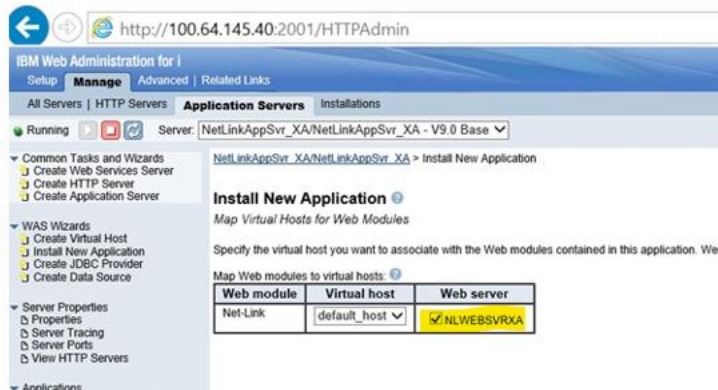

15 Select **Application is contained in a WAR file** and click **Browse** to locate and select the WAR file located on the IFS from Step 1 and then at Context root field, update with */myContextRoot* value (for eg:/NetLink) and Click **Next**.

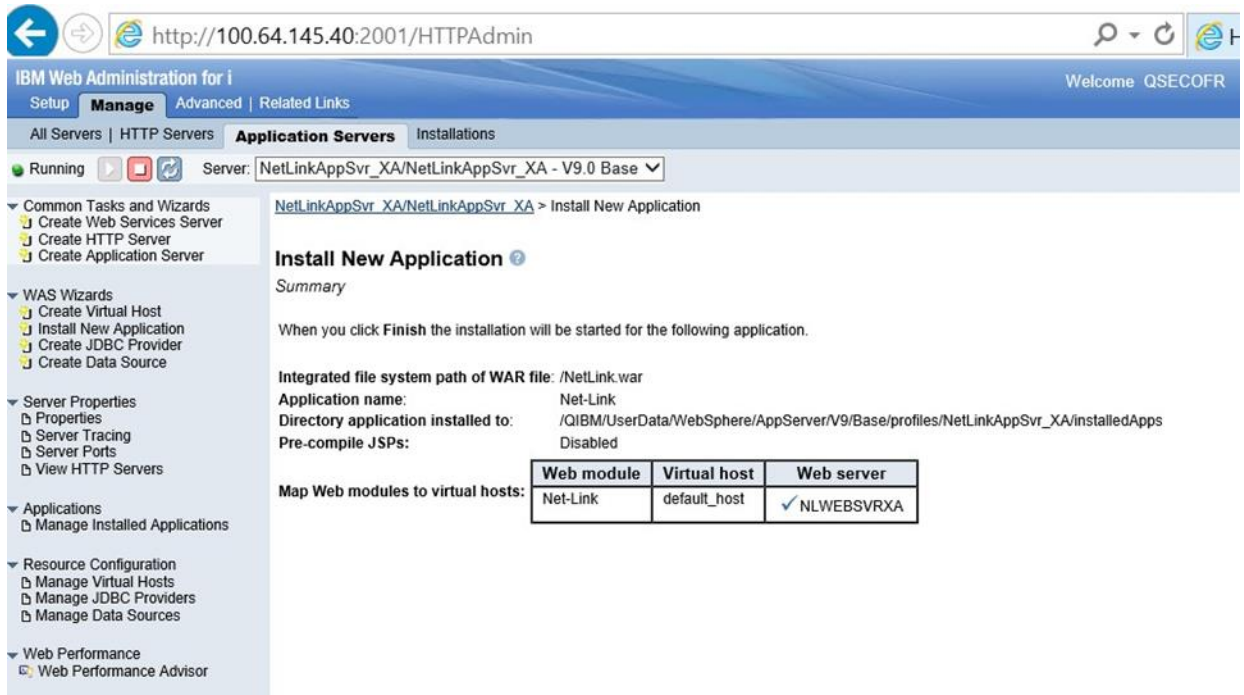

16 Click Next.

17 Check the Web server checkbox and Click Next.

18 Click Finish.

- 19 If you did not change the default port (36001) to the new port and continued with the warning 'port is already configured by another application', then complete steps in "**Appendix A Reset Port on Warning**" to change the default port to different port to avoid further issues due to port clash.
- 20 After successful deployment of Net-Link application through above steps, complete the SSL/TLS process by following steps in "**Chapter 5 Configuring TLS**".

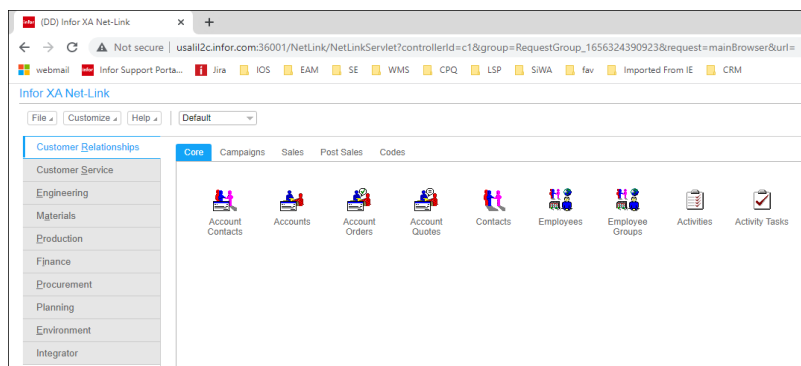

Chapter 3 IDFIONAPI WAR file Generation and Deployment

This Chapter is not applicable for Customers only using Net-Link to use XA in SiWA or Infor OS Portal. The IDFIONAPI component of IDF used to connect with ION CE using IMS needs to be deployed to a server accessible to ION CE. Customers want to use IMS via ION API to receive inbound BODs from ION CE, need this IDFIONAPI component.

This component should be accessible by IONCE running on Infor OS Portal using AWS. This component should be accessible from public network using secured port. Call to this component from AWS can be allowed using specific IP and port by whitelisting only the IPs related to Infor OS Portal based. Infor OS team can provide the valid Portal IPs that Customer's IT need to whitelist and allow access to this component.

WAR file generation in XA R10

Log in to Net-Link for the environment.” <http://usallil2c.infor.com:36001/NetLink>”

In the Address bar, replace the “/NetLinkServlet?.....” with “/WebArchive?archive=IMS” (e.g. “http://usall2c.infor.com:36001/NetLink/WebArchive?archive=IMS”), and press enter.

The war file is generated and downloaded to the local machine.

WAR file deployment on WebSphere

The IDFIONAPI deployment process utilizes the WebSphere Wizard function to create an IDFIONAPI Application and associated HTTP server.

Check that you have the following subsystem running, and that all ADMIN jobs are running within the subsystem:

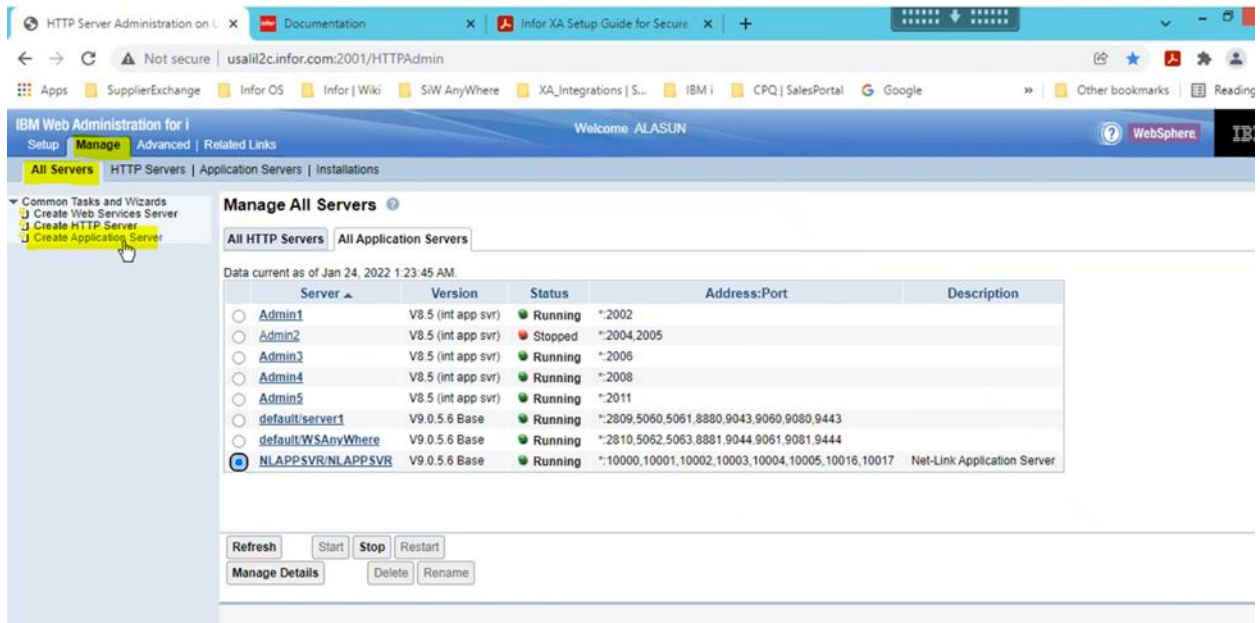

WRKSBSJOB QHTTPSVR

If the subsystem is not active, issue the following OS400 command:

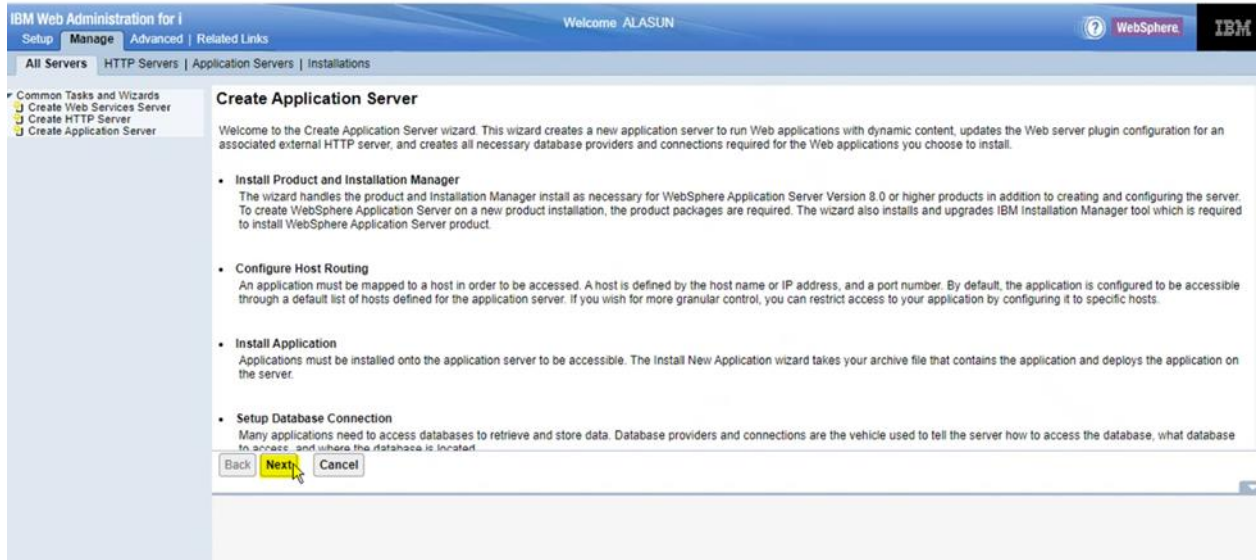

STRTCPSVR SERVER(*HTTP) HTTPSVR(*ADMIN)

For deployment of WAR file using WebSphere, execute below steps:

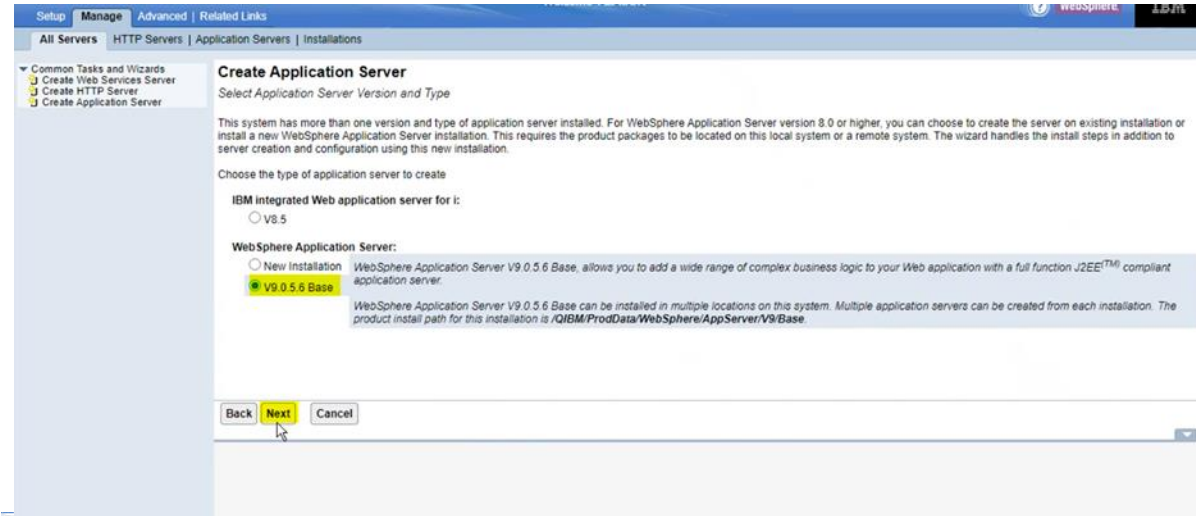

- 1 Copy the WAR file to a location on the IFS of the iSeries which is preferably a 'temp' folder. However, the location can also be in the root.
- 2 Open the HTTP Administration console (<http://{hostName}:2001/HTTPAdmin>) and log in with *SECADM authority.
- 3 Select the Manage, and All Servers tab.

4 Select Create Application Server and Click Next.

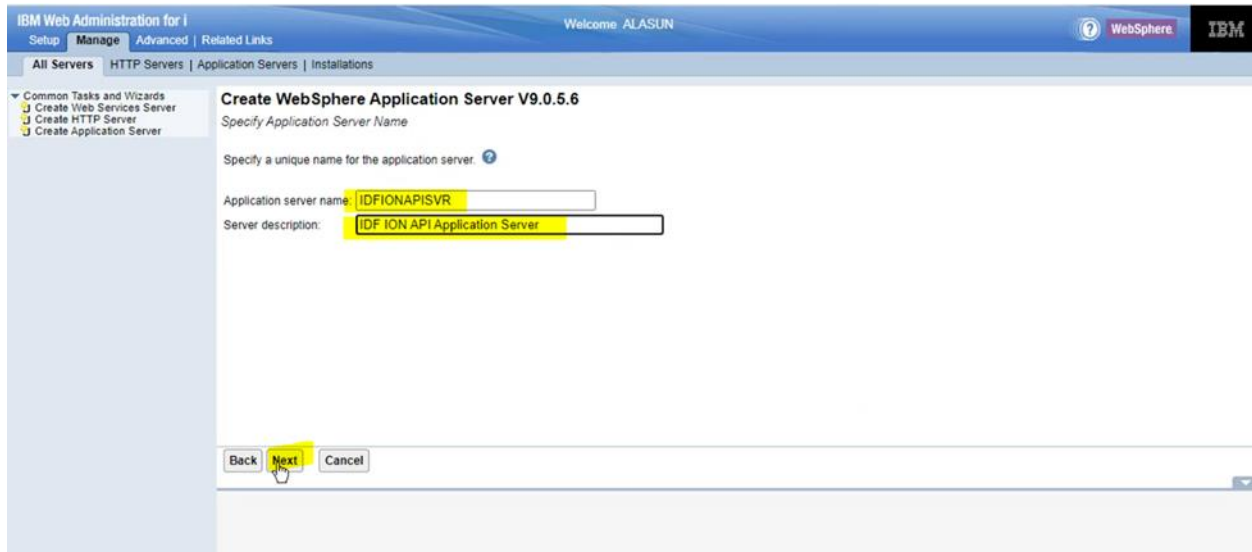

5 Select V9.0.0.xx Base and Click Next.

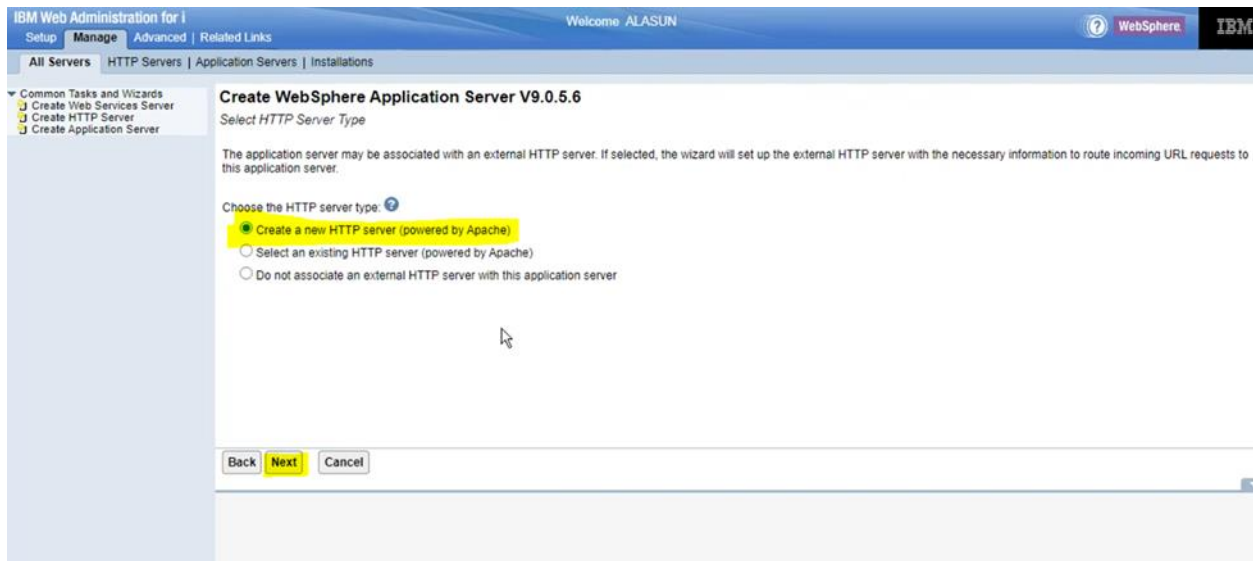

6 Enter below Application server name, description and Click Next.

Application server name: IDFIONAPISVR

Server description: IDF ION API Application Server

7 Select Create a new HTTP server and Click Next.

8 Enter below HTTP server name, HTTP server description and Click Next.

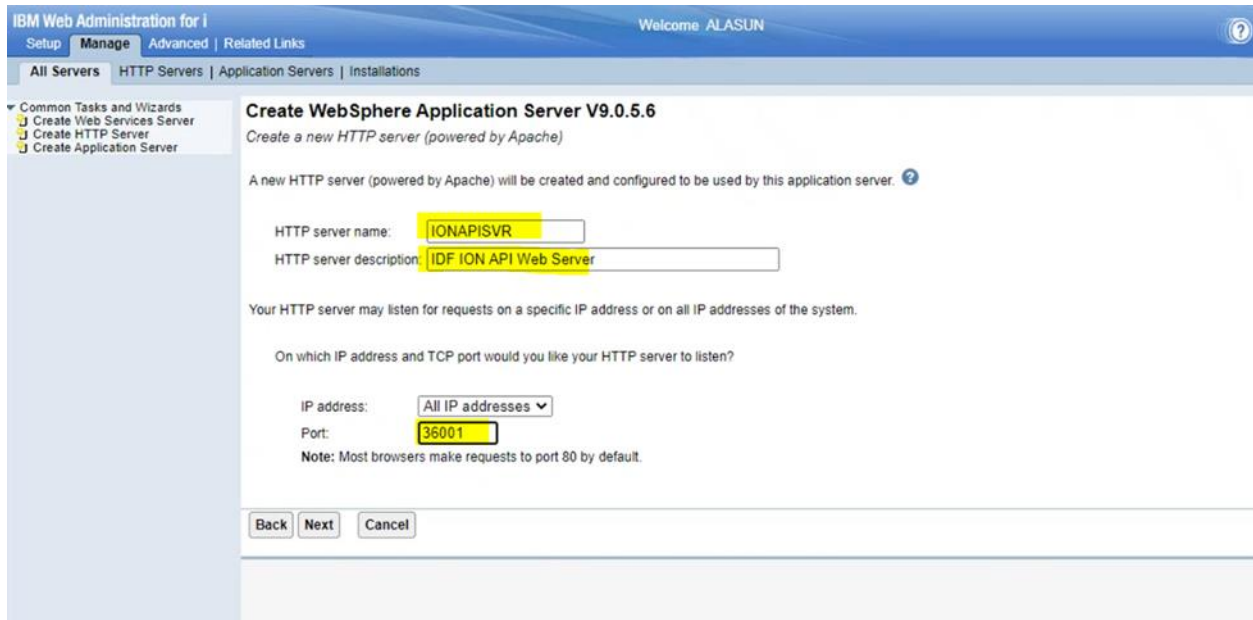

HTTP server name: IONAPISVR

HTTP server description: IDF ION API Web Server

IP address: All IP address

Port: 36001

Note: The port should be the same as that you have used in the WAR file generation section

9 Click **Next**.

 Create Application Server

Create WebSphere Application Server V9.0.5.6

Create a new HTTP server (powered by Apache)

A new HTTP server (powered by Apache) will be created and configured to be used by this application server. ?

HTTP server name:

HTTP server description:

Your HTTP server may listen for requests on a specific IP address or on all IP addresses of the system.

On which IP address and TCP port would you like your HTTP server to listen?

IP address:

Port:

Note: Most browsers make requests to port 80 by default.

Warning: The port 36001 is already configured by another application. Specify a different port or click Next to continue using this port. ⚠

10 Accept the default First port in range: default values and Click **Next**.

IBM Web Administration for i Welcome ALASUN

Setup **Manage** Advanced | Related Links WebSphere IBM

All Servers HTTP Servers Application Servers Installations

Common Tasks and Wizards
 Create Web Services Server
 Create HTTP Server
 Create Application Server

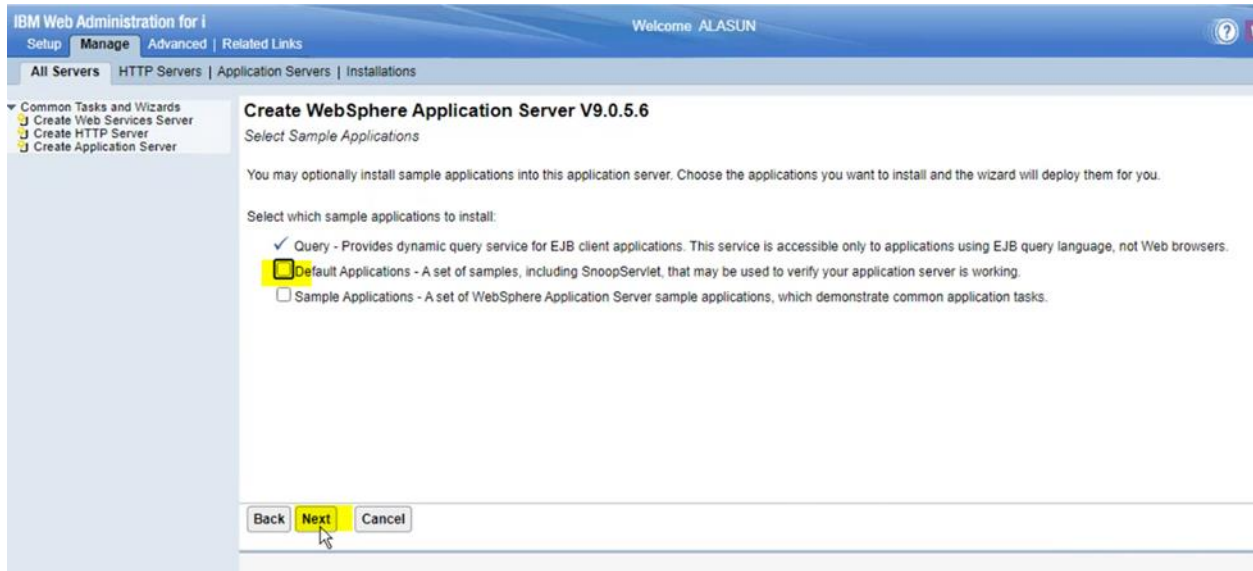

Create WebSphere Application Server V9.0.5.6

Specify Internal Ports Used by the Application Server

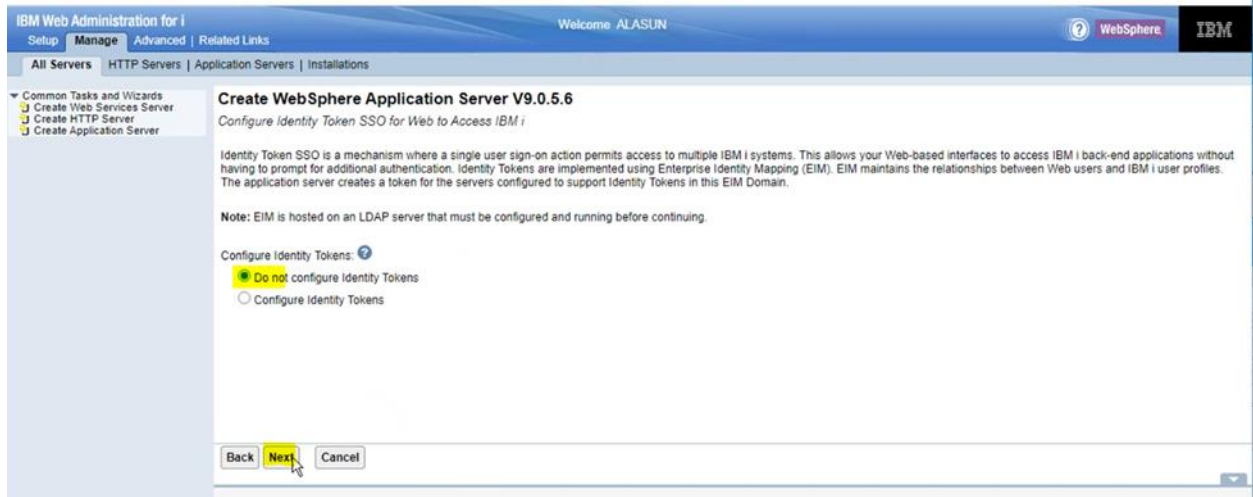

The application server uses several internal services such as internal HTTP transport service, Simple Object Access Protocol (SOAP) service, name service, and several other services to perform its processing. In order for these services to be configured, you must provide a block of 20 consecutive ports that are currently not in use on your system. Specify the first TCP port number in the range and the wizard will assign the ports that are to be used by each internal service. For example, if 10020 is entered as the first port in the range, then ports 10020 to 10039 will be configured.

First port in range:

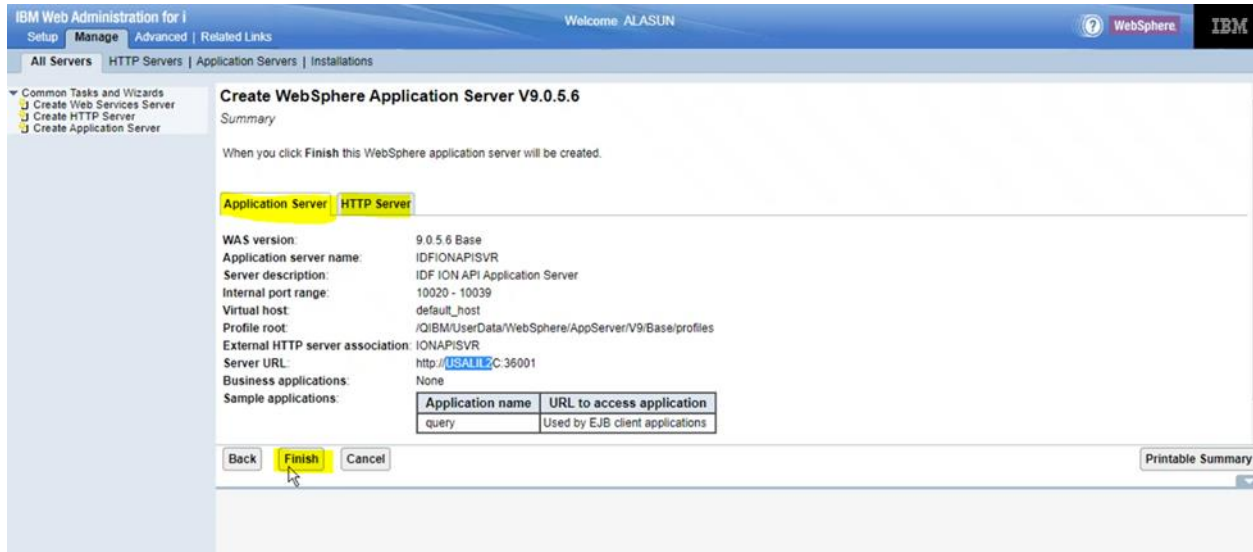

11 Deselect Default Applications and Click **Next**.

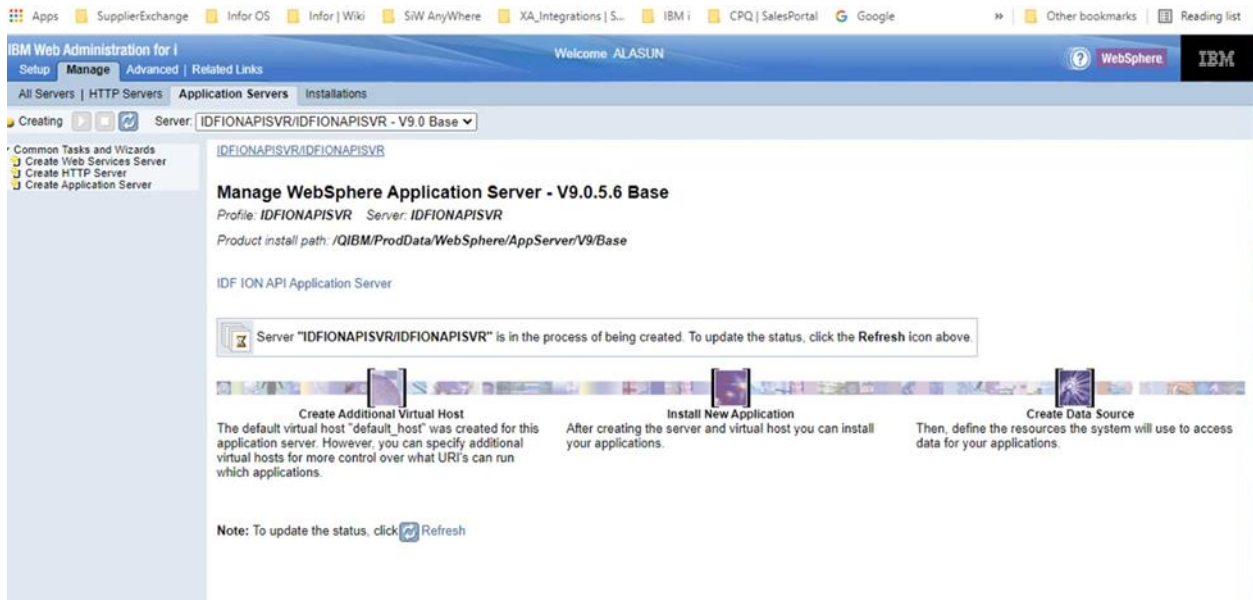

12 Select "Do not configure Identity Tokens" and Click **Next**

13 Review the Summary and Click Finish.

14 Wait until the creation process is complete.

15 Click on refresh to update the status.

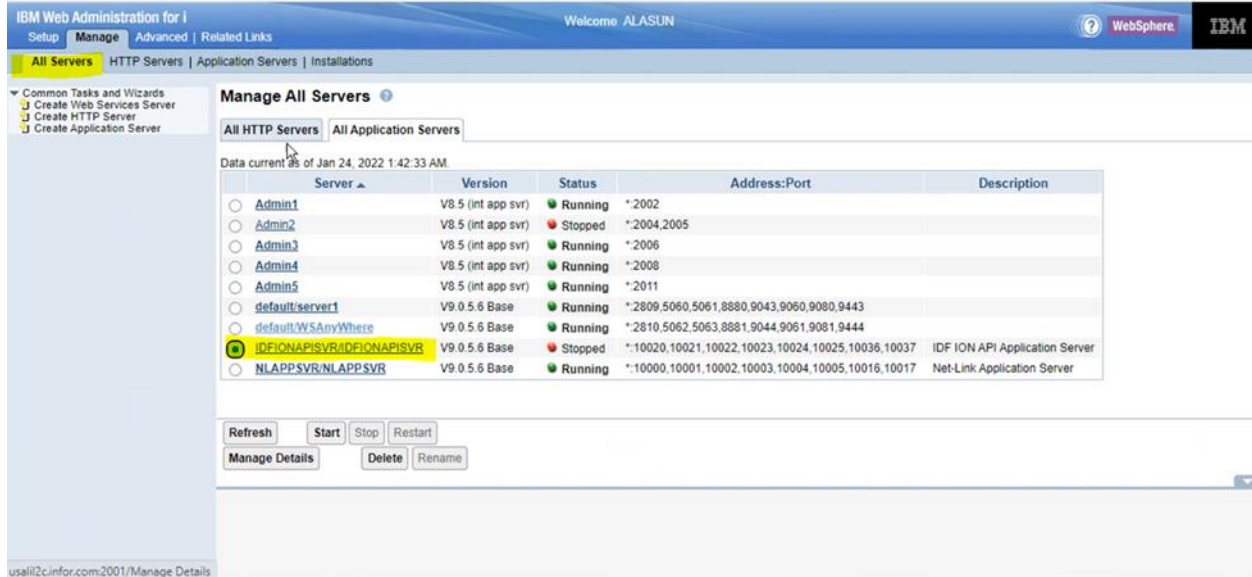

IDFIONAPI WAR file Generation and Deployment

The screenshot shows the IBM Web Administration console for the 'Manage' tab. The server 'IDFIONAPISVR/IDFIONAPISVR - V9.0 Base' is currently 'Stopped'. The main content area displays the 'Manage WebSphere Application Server - V9.0.5.6 Base' configuration page. It includes a navigation pane on the left with categories like 'Common Tasks and Wizards', 'WAS Wizards', 'Server Properties', 'Applications', 'Resource Configuration', 'Web Performance', 'Problem Determination', and 'Tools'. The main area shows the server profile 'IDFIONAPISVR' and the product install path. Below this, there are three steps: 'Create Additional Virtual Host', 'Install New Application', and 'Create Data Source'. A table shows the current configuration for the server, including virtual hosts (default_host, admin_host), installed applications (SwaggerUI, query, RESTAPI Docs, 1vtApp), and data sources (DefaultEJBTimerDataSource). A note at the bottom indicates that the status can be updated by clicking the 'Refresh' button.

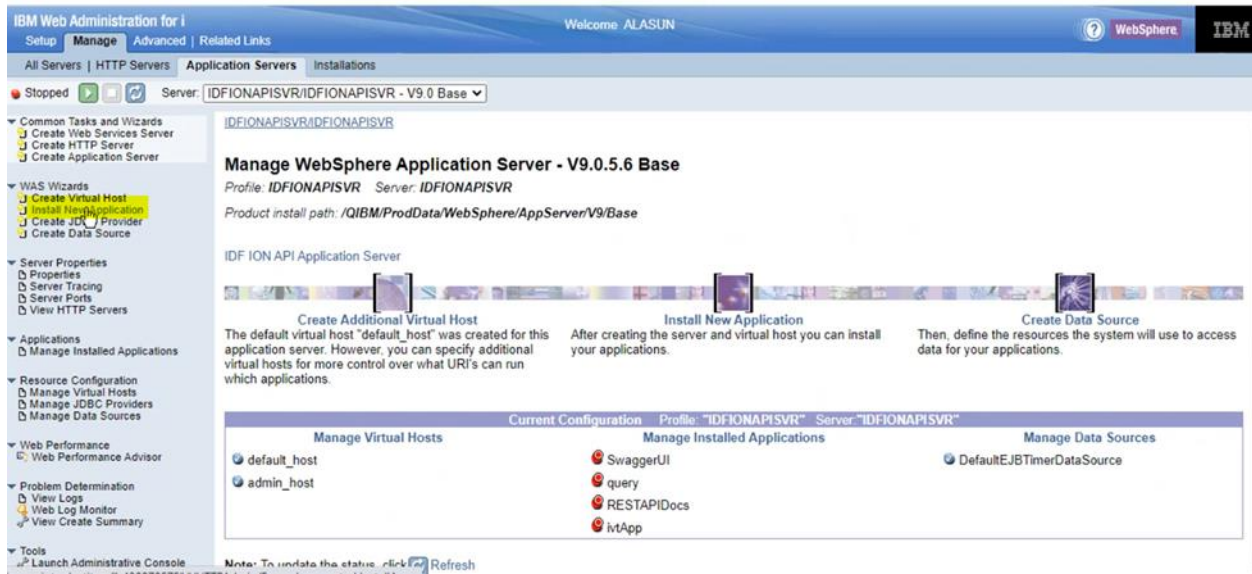

16 Check for the newly created server in All Servers.

The screenshot shows the 'Manage All Servers' page in the IBM Web Administration console. The 'All HTTP Servers' tab is selected. The page displays a table of server instances with columns for Server, Version, Status, Address:Port, Associated Application Server, and Description. The 'IDFIONAPISVR' server is highlighted in yellow and is currently 'Stopped'. Below the table, there are buttons for 'Refresh', 'Start', 'Stop', 'Restart', 'Manage Details', 'Delete', and 'Rename'. The data is current as of Jan 24, 2022 1:42:46 AM.

Server	Version	Status	Address:Port	Associated Application Server	Description
ADMIN	Apache/2.4.20 (IBM I)	Running	*:2001	None	Administration server
AJSP	Apache/2.4.20 (IBM I)	Stopped	*:8210	None	
APACHEDEF	Apache/2.4.20 (IBM I)	Stopped	*:80	None	IBM supplied sample HTTP server (powered by Apache)
IDFIONAPISVR	Apache/2.4.20 (IBM I)	Stopped	*:36001	IDFIONAPISVR, V9.0 Base	IDF ION API Web Server
IWADEF	Apache/2.4.20 (IBM I)	Stopped	*:2020	None	
NLWEBSVR	Apache/2.4.20 (IBM I)	Running	*:36410	NLAPPSVR, V9.0 Base	Net-Link Web server
WQLWITZ	Apache/2.4.20 (IBM I)	Stopped	*:11331	None	
WSANYWHERE	Apache/2.4.20 (IBM I)	Running	*:443	default, V9.0 Base	SIWA Websphere on L2C

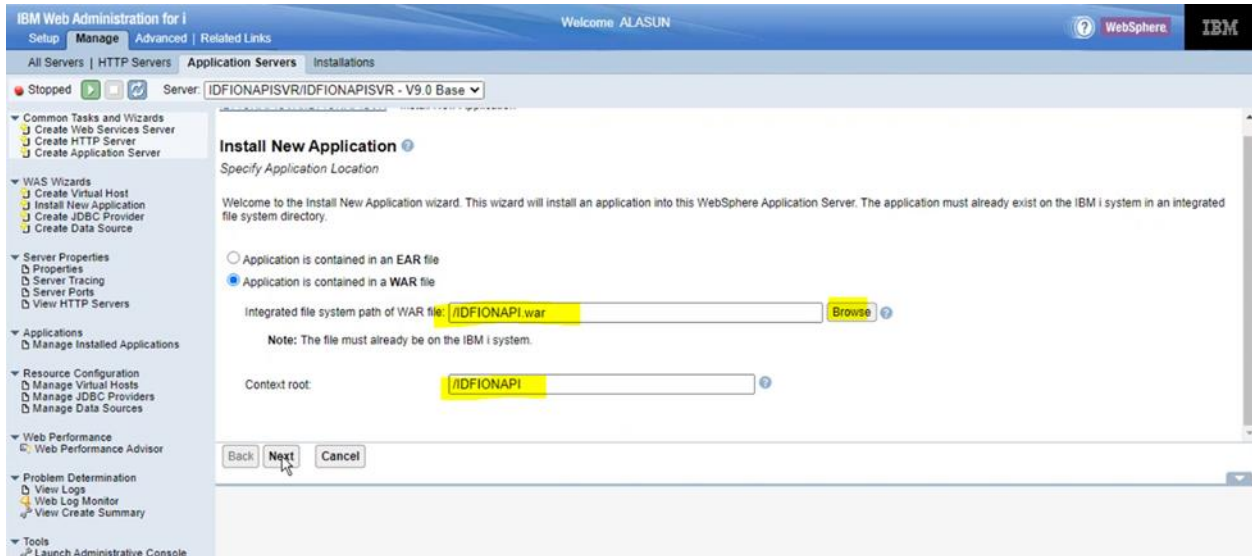

17 Click on the created application server (IDFIONAPISVR) and Select Install New Application from the WAS Wizards menu.

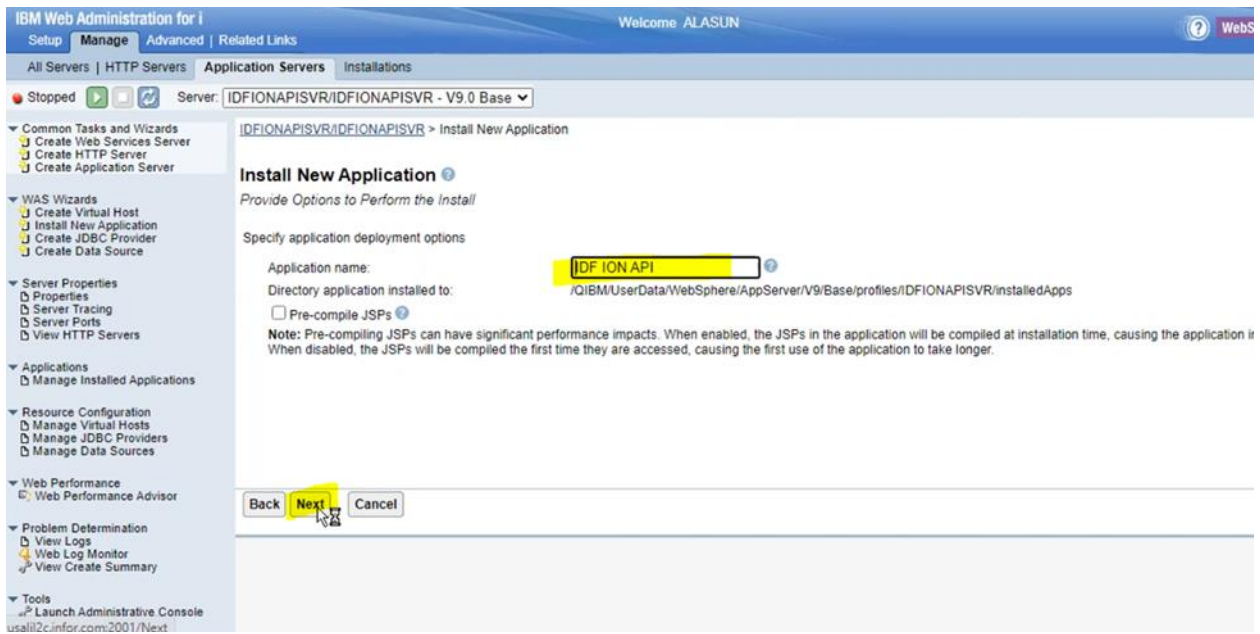

18 Select Application is contained in a WAR file and click Browse to locate and select the WAR file located on the IFS from Step 1 and then at Context root field, update with /myContextRoot value (for eg:/IDFIONAPI) and Click Next.

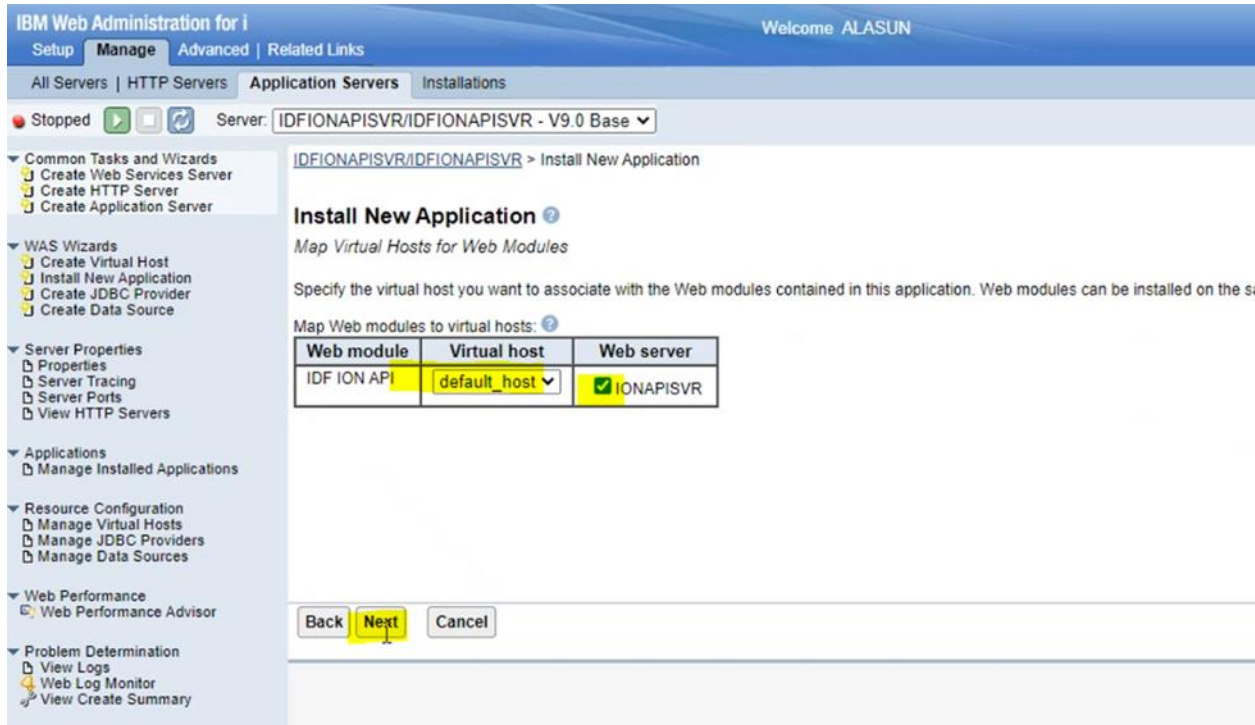

IDFIONAPI WAR file Generation and Deployment

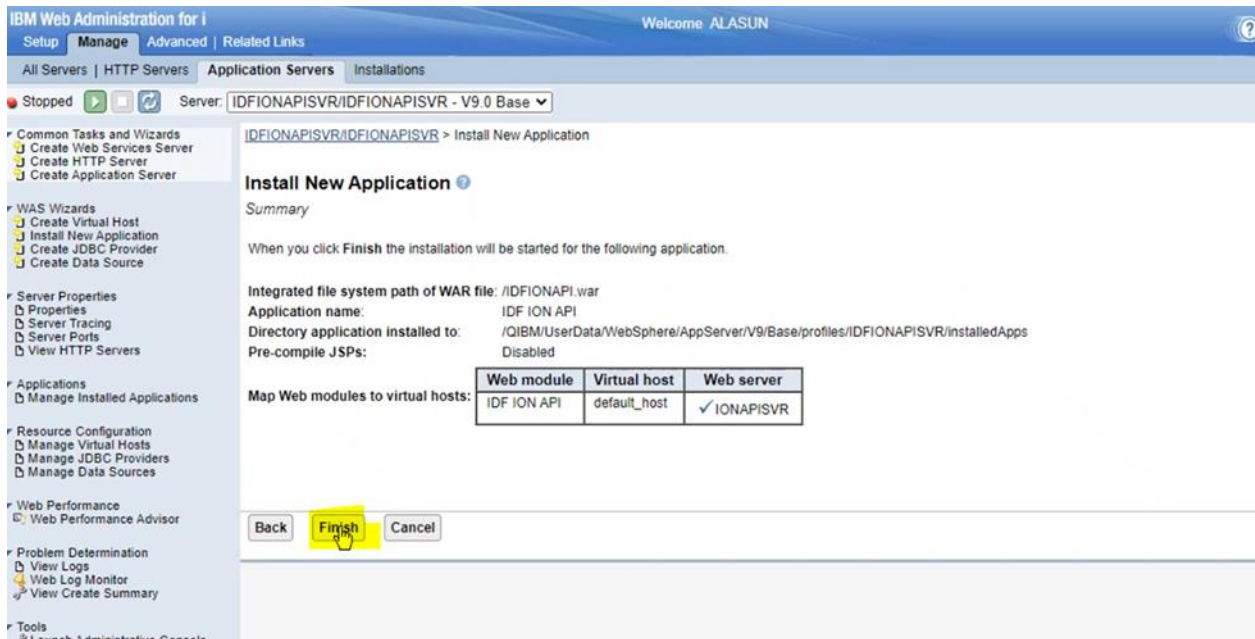

19 Click Next.

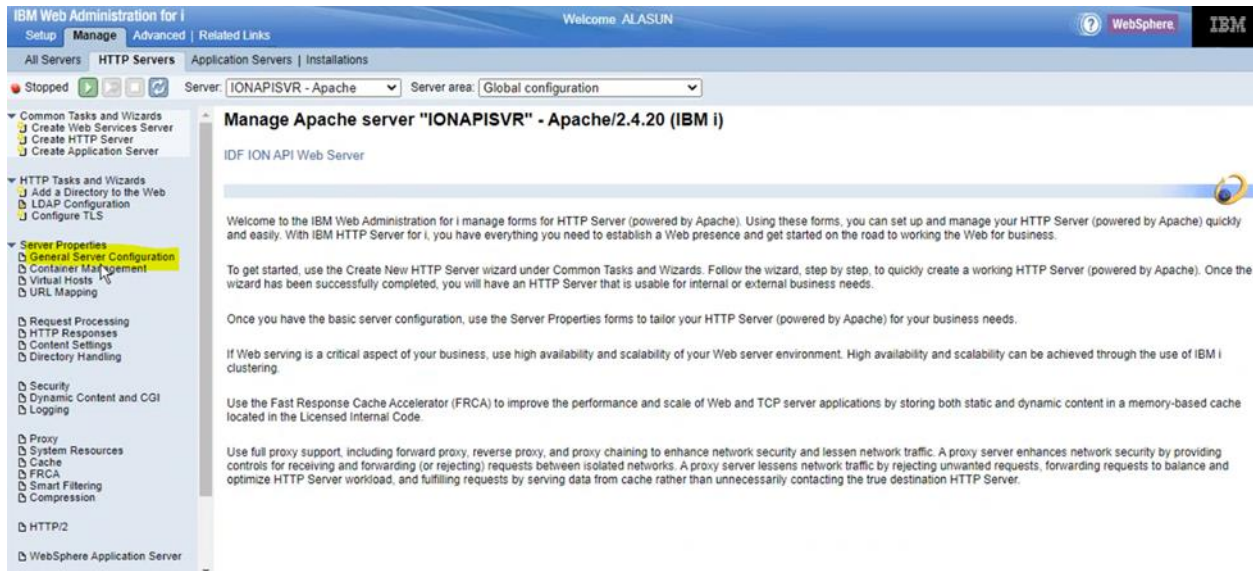

20 Check the Web server checkbox and Click Next.

21 Click on **Finish**.

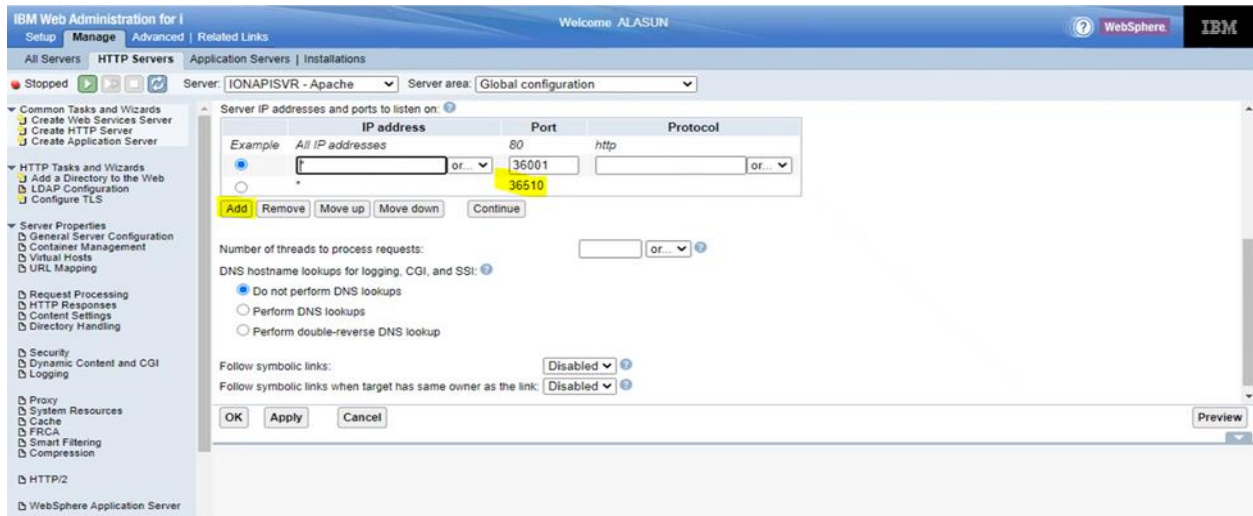

22 Now go to manage http servers, in IDFIONAPI Web Server, click on general server configuration.

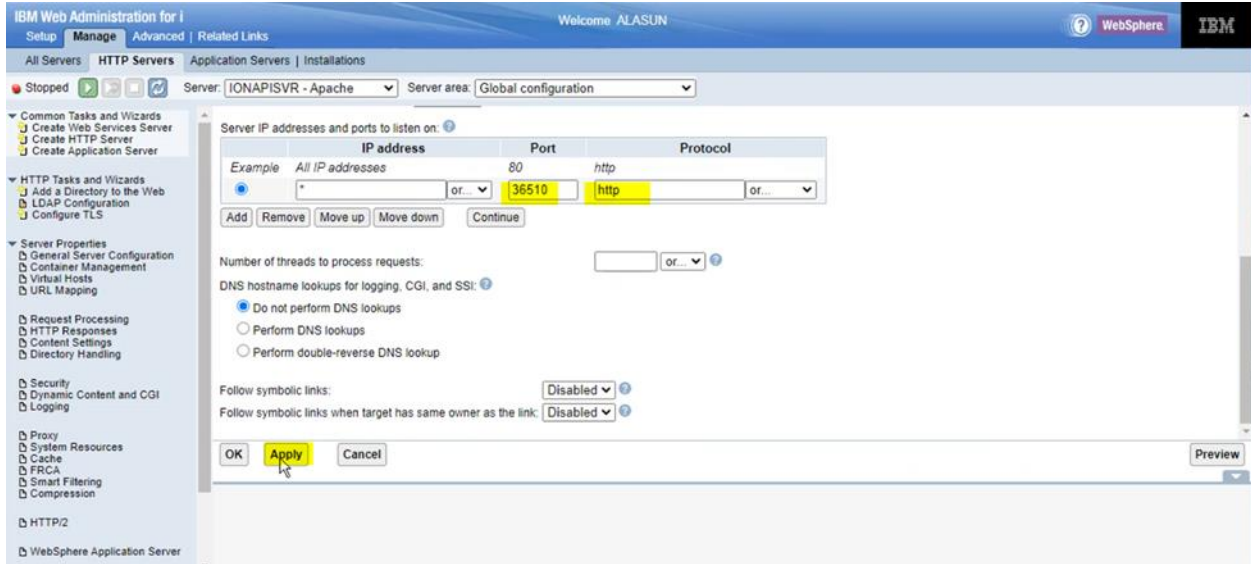

23 Click on add to add the new port and remove the old port. Secured port **443** is a preferable port for IDFIONAPI. But if that port is in use by other applications on the server, then you can use a different port. The same port should be secured and made available for ION CE to connect with IDFIONAPI by making necessary network changes.

Port: 36510

Protocol: http

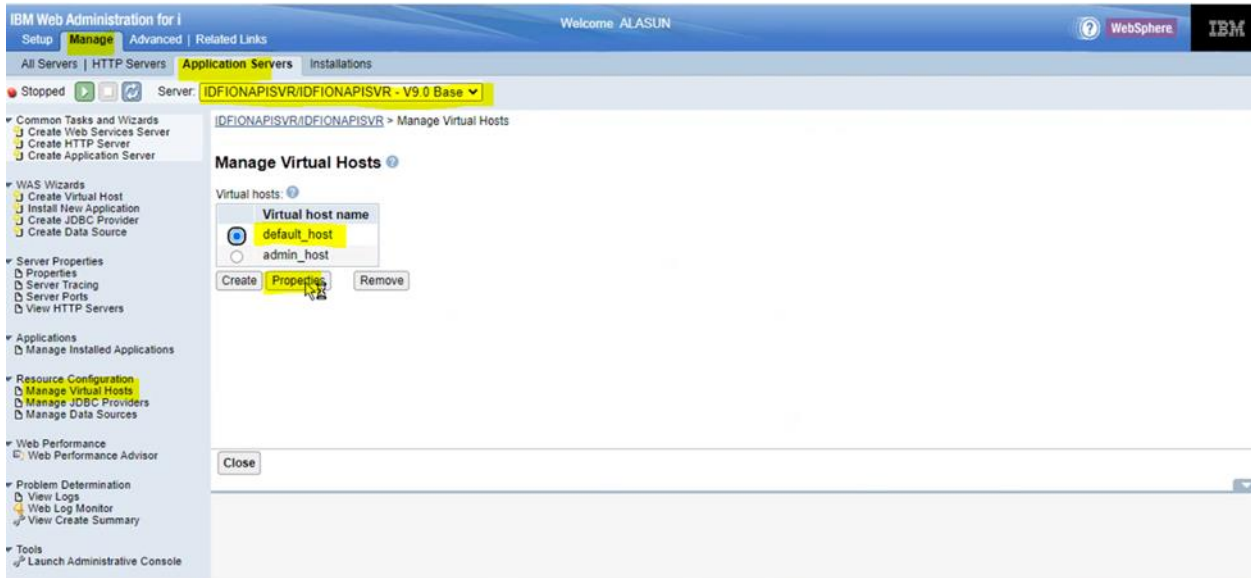

24 Click on **Apply** then **OK**.

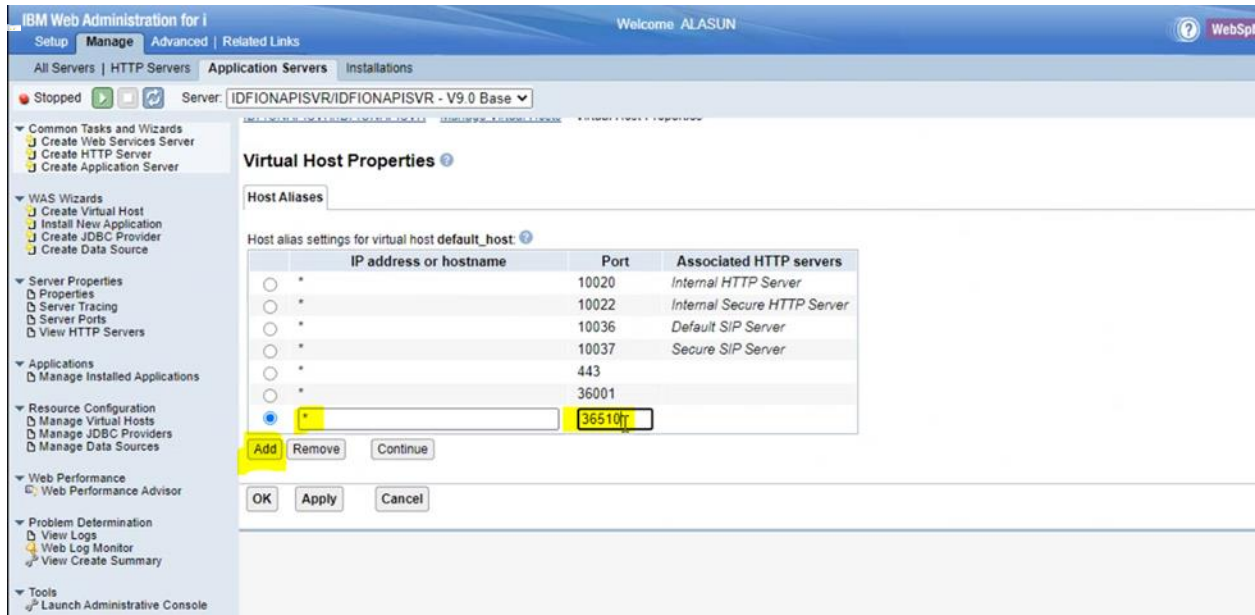

25 Select the Manage Virtual Hosts under Resource Configuration from the IDFIONAPISVR Application server, as shown in below screenshot.

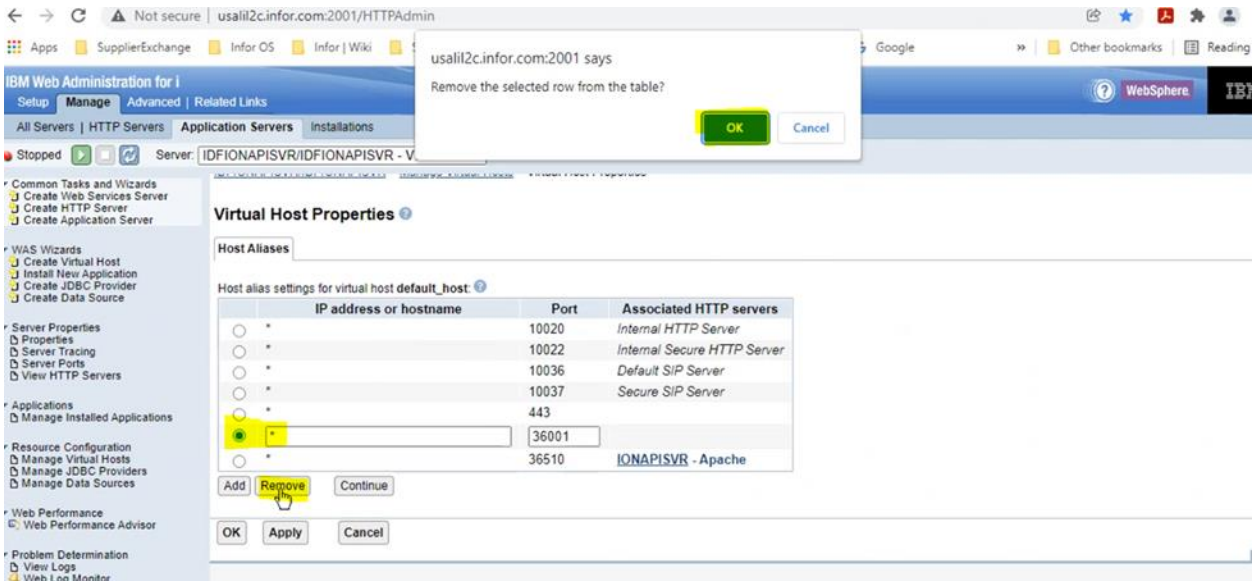

Select the default host and Click Properties

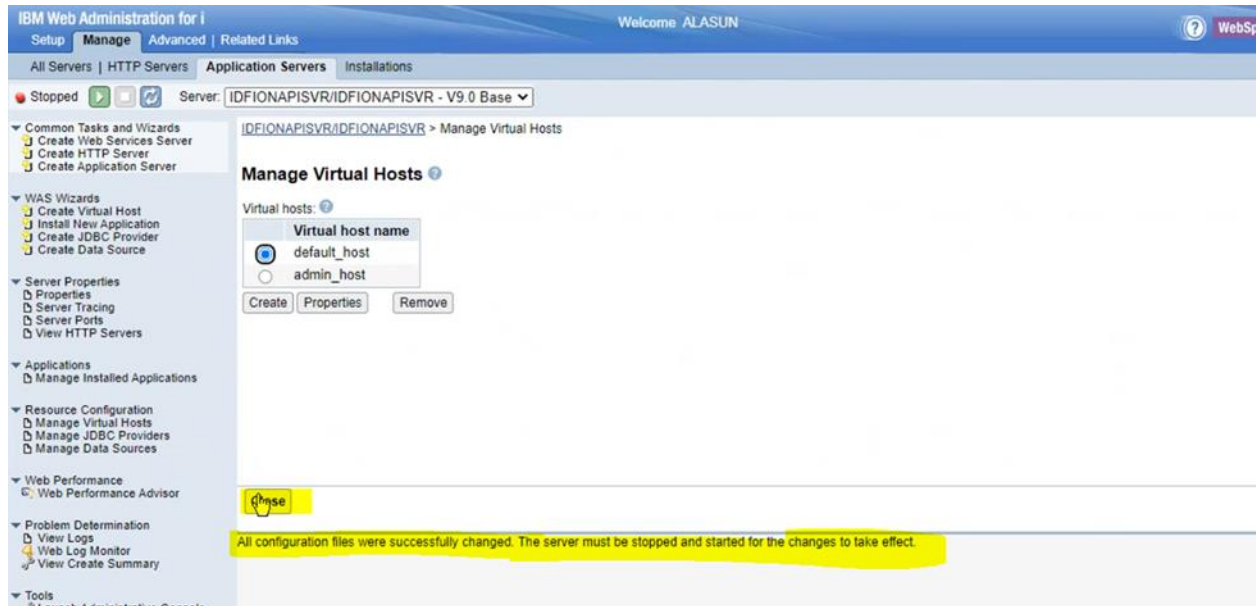

26 Click Add to add a Host Aliases (In the below example, added 36510 as a port).

27 Select the 36001 port and Click Remove. Click Apply.

28 Click on close. As all configuration is saved, the server must be restarted.

29 After successful deployment of IDFIONAPI application, complete the SSL/TLS process by following steps in “Chapter 5 Configuring TLS”.

11-

Chapter 4 WAR file Re-deployment

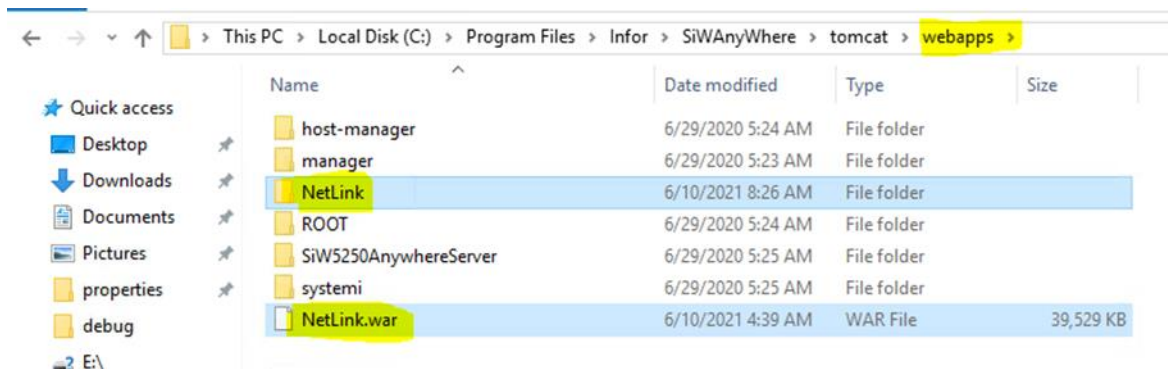

This section explains the procedure to re-deploy the WAR file for Net-Link or IDFIONAPI applications. We perform this section only, whenever we want to redeploy the war file with new changes.

WAR file generation

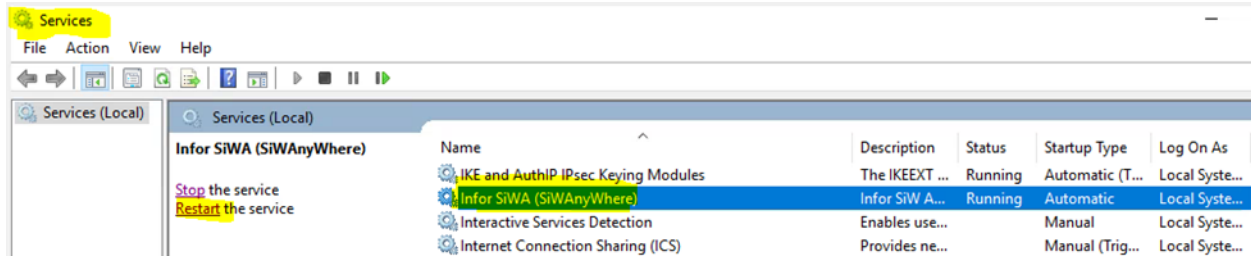

Follow the required “**WAR file generation**” chapter in this document based on your application.

Re-deployment on Tomcat

- 1 Delete or take the backup of the NetLink.war file & NetLink folder from the root of the webapps folder of the Tomcat instance, shown below.

- 2 The redeployment of WAR file involves copying the WAR file to the root of the webapps folder of the Tomcat instance. The update is automatically loaded by Tomcat.
- 3 Restart the Infor SiWA service from Windows Services, shown as below.

Re-deployment on WebSphere (version 9.x)

Check that you have the following subsystem running, and that all ADMIN jobs are running within the subsystem:

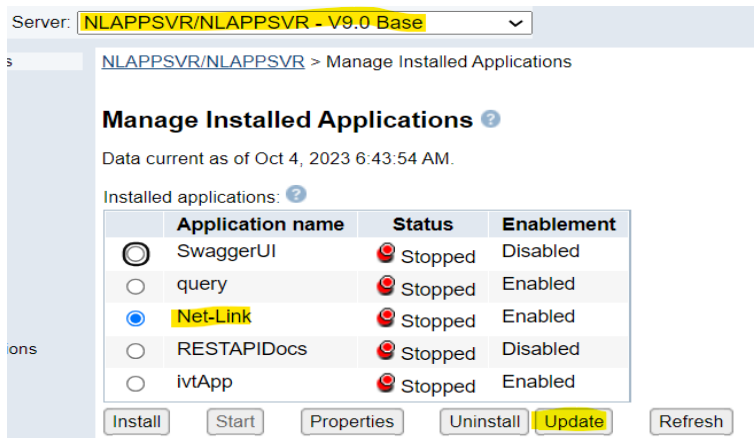

WRKSBSJOB QHTTPSVR

If the subsystem is not active, issue the following OS400 command:

STRTCPSVR SERVER(*HTTP) HTTPSVR(*ADMIN)

For deployment of WAR file using WebSphere, execute below steps:

- 1 Replace the existing Net-Link WAR file with the new Net-Link WAR file on the IFS of the iSeries which is preferably a 'scratch' folder. However, the location can also be in the root.
- 2 Open the HTTP Administration console (<http://{hostName}:2001/HTTPAdmin>), and log in with *SECADM authority.
- 3 Stop the HTTP server and its associated Application server instances for both the SiWA & Net-Link applications.
- 4 Click on the Net-Link application server (NLAPPSVR/NLAPPSVR) and then Select **Manage Installed Applications** under **Applications**.
- 5 Select the **Net-Link** application and click on **Update**, as shown below.

- 6 Select the “**Application is connected in a WAR file**”, click on **Browse**.

Update Application

Welcome to the Update Application wizard. This wizard updates and redeploys an existing application on the Application Server. The installed application. The EAR or WAR file for the application must already exist on the IBM i system in an integrated file system d

Application name: **Net-Link** 

Application is contained in an **EAR** file

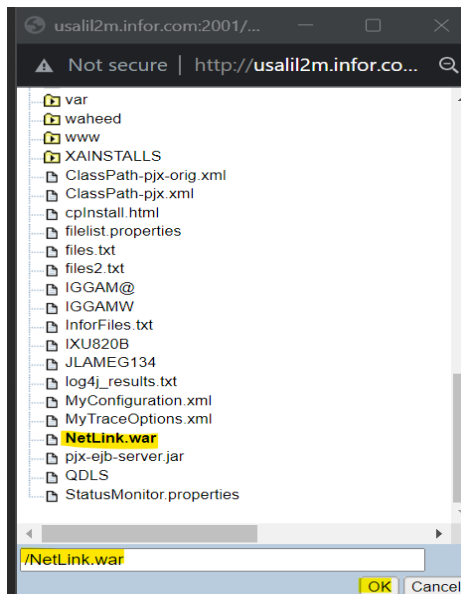

Application is contained in a **WAR** file

 **Integrated file system path of WAR file:** **Browse** 

Note: The file must already be on the IBM i system.

Pre-compile JSPs 

- 7 Select the latest NetLink.war file and click on “**OK**”.

- 8 Click on Update.

Update Application ?

Welcome to the Update Application wizard. This wizard updates and redeploys an existing application on the Application Server installed application. The EAR or WAR file for the application must already exist on the IBM i system in an integrated file system

Application name: **Net-Link** ?

- Application is contained in an **EAR** file
- Application is contained in a **WAR** file

 **Integrated file system path of WAR file:**

Note: The file must already be on the IBM i system.

- Pre-compile JSPs ?

9 The Status of the Net-Link is now changed to Updating.

Manage Installed Applications ?

Data current as of Oct 4, 2023 6:55:40 AM.

Installed applications: ?

	Application name	Status	Enablement
<input type="radio"/>	SwaggerUI	 Stopped	Disabled
<input type="radio"/>	query	 Stopped	Enabled
<input checked="" type="radio"/>	Net-Link	 Updating	Disabled
<input type="radio"/>	RESTAPIDocs	 Stopped	Disabled
<input type="radio"/>	ivtApp	 Stopped	Enabled

10 After successful update, the status of the Net-Link will change to Stopped.

Manage Installed Applications ?

Data current as of Oct 4, 2023 7:09:56 AM.

Installed applications: ?

	Application name	Status	Enablement
<input checked="" type="radio"/>	SwaggerUI	 Stopped	Disabled
<input type="radio"/>	query	 Stopped	Enabled
<input checked="" type="radio"/>	Net-Link	 Stopped	Enabled
<input type="radio"/>	RESTAPIDocs	 Stopped	Disabled
<input type="radio"/>	ivtApp	 Stopped	Enabled

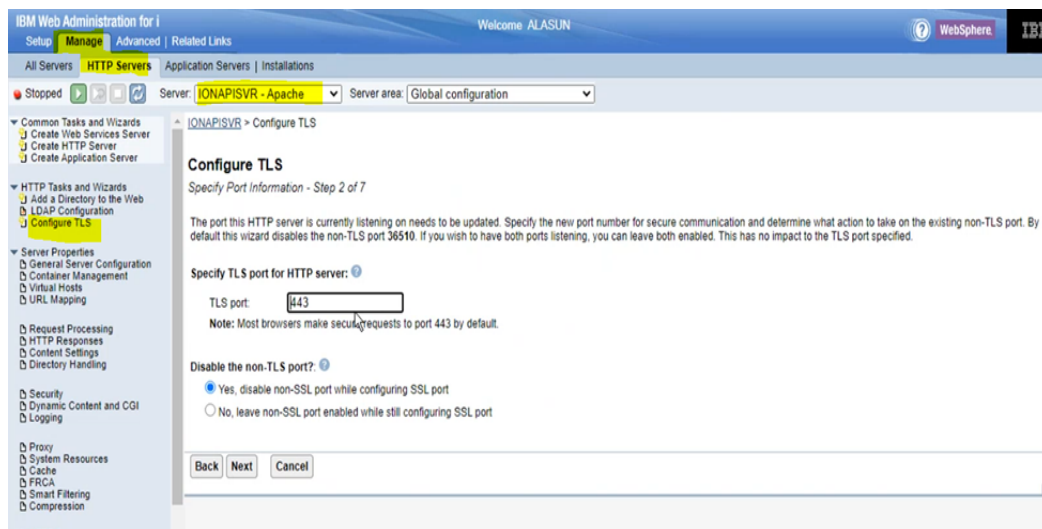

11 Start the HTTP server and its associated Application server instances for both the SiWA & Net-Link applications.

Chapter 5 Configuring TLS

To secure applications like Net-Link, WSANYWHERE and IDFIONAPI the steps below need to be followed.

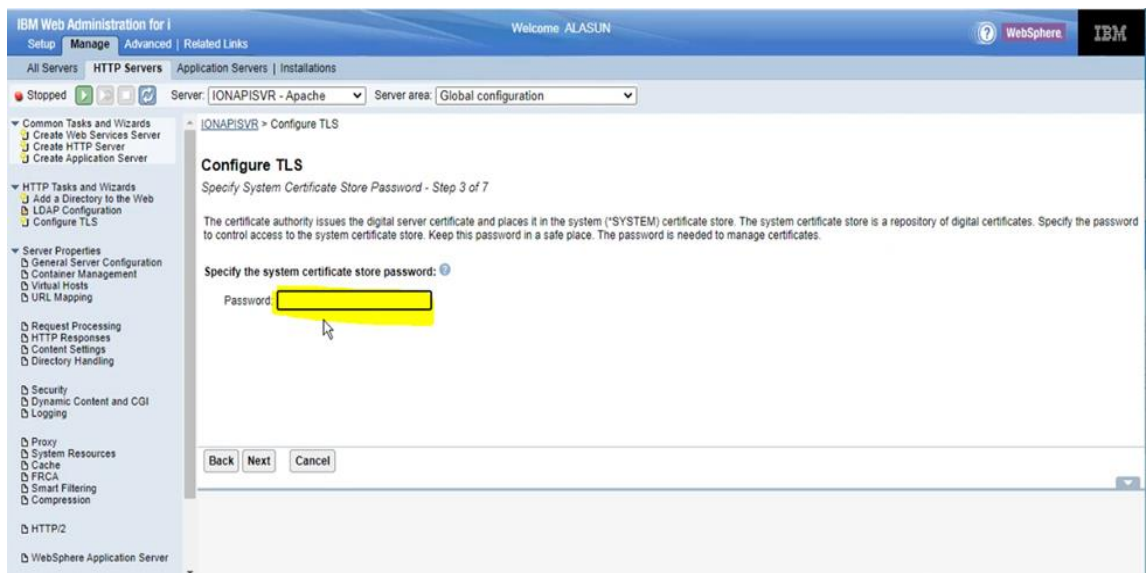

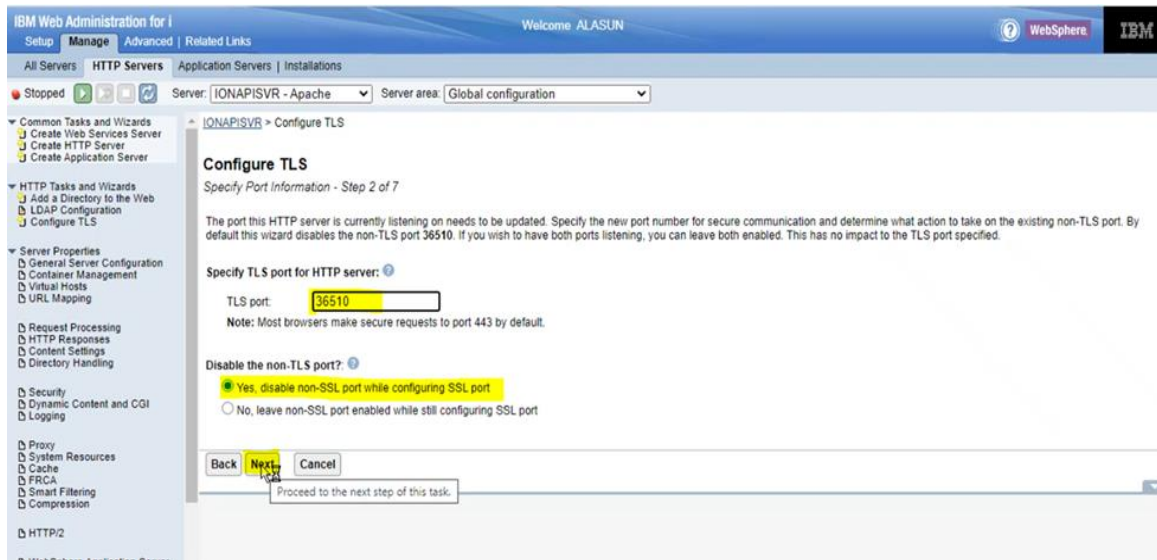

Securing IDFIONAPI application is shown below as an example.

- 1 Select Manage tab | Select HTTP Servers tab | Select Configure TLS – (HTTP Tasks and Wizards).

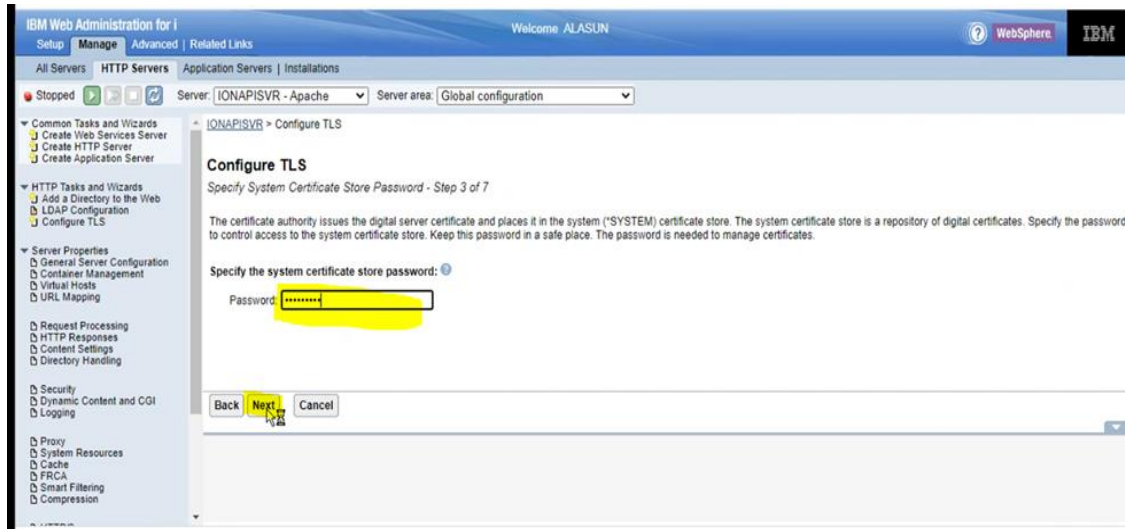

- 2 Give the required port number (Ex: 36510) select radio button for “Yes, disable non-SSL...” and Click Next.

Note: If you have received the warning ‘**port is already configured by another application**’ while deploying the Net-Link or WSANYWHERE or IDFIONAPI application and performed Port Warning rest instructions by following “**Appendix A Reset Port on Warning**”, then specify that new port number as **TLS Port** number. Otherwise, proceed with the default port.

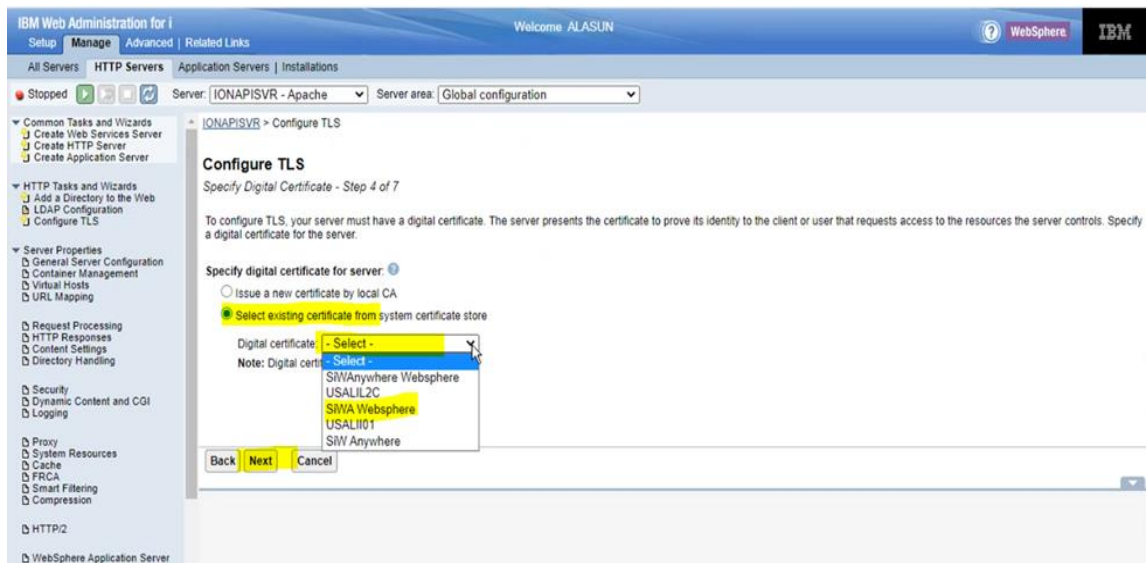

- 3 Enter the required system certificate store password. If password is not available, please check with the IBMi admin or IT team.
- 4 Enter the password and click on **Next**.

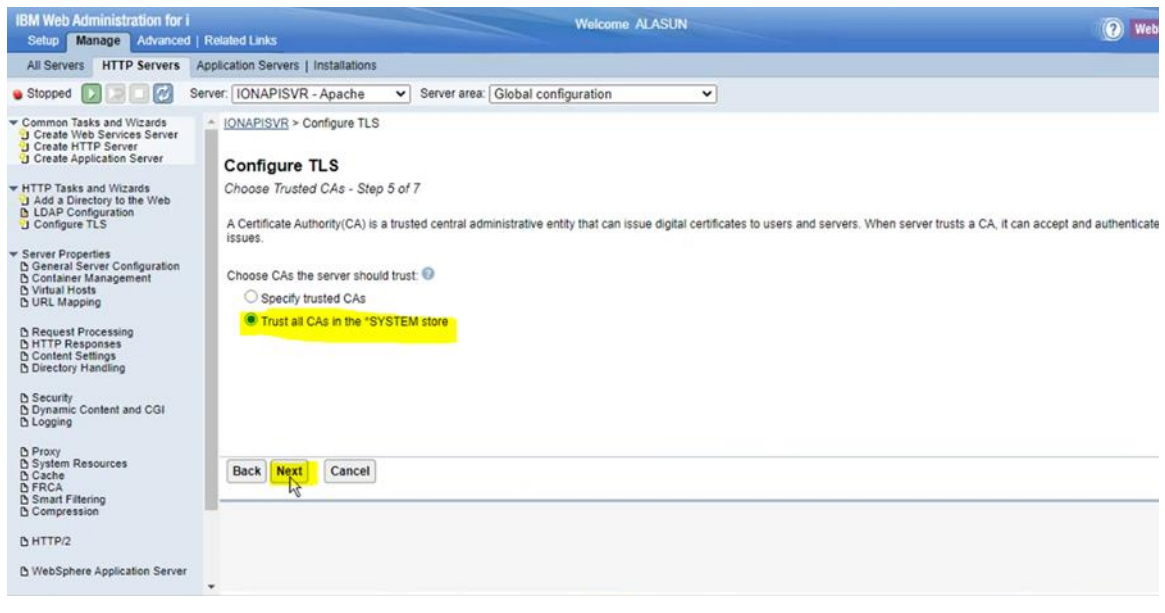

Configuring TLS

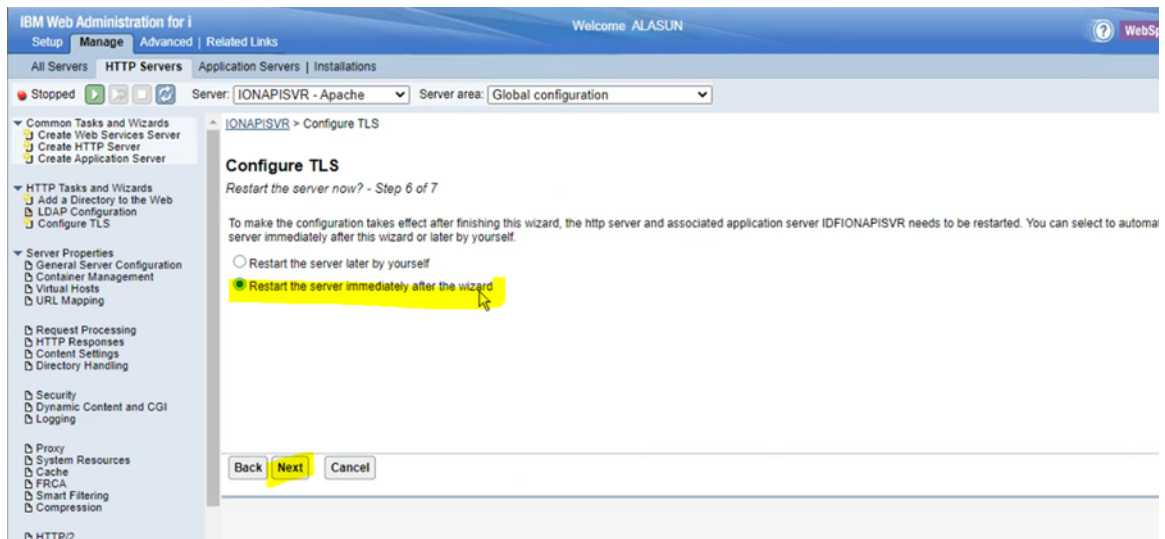

- 5 Select existing certificate from system certificate store. And select SIWA WebSphere.

- 6 Select "Trust all CAs in the *SYSTEM store" and click on **Next**.

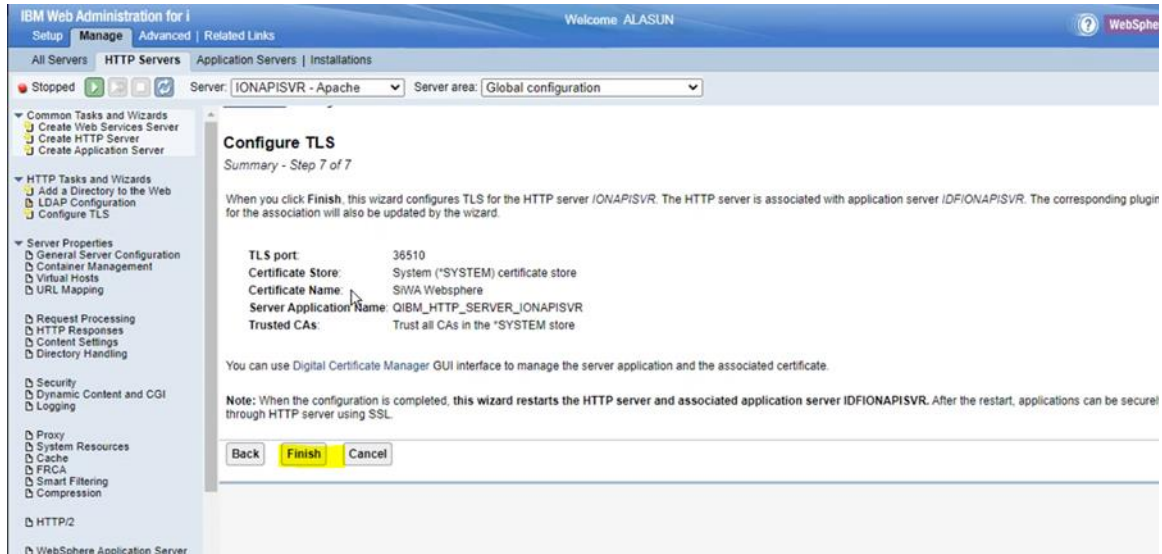

- 7 Select restart the server immediately option and click **Next**.

- 8 Click on finish and the servers will be restarted.

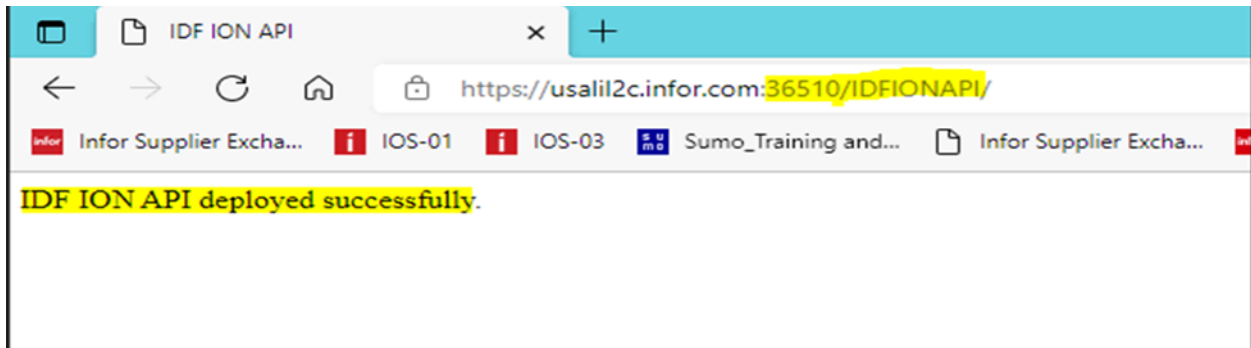

Configuring TLS

9 After restart validate if the IDFIONAPI deployment is successful.

10 Launch secured URL "<https://usalil2c.infor.com:36510/IDFIONAPI/>"

11 "IDF ION API deployed successfully" will be displayed.

Note: In the case of secured Net-Link, launch the URL and see if application is Net-Link launching fine.

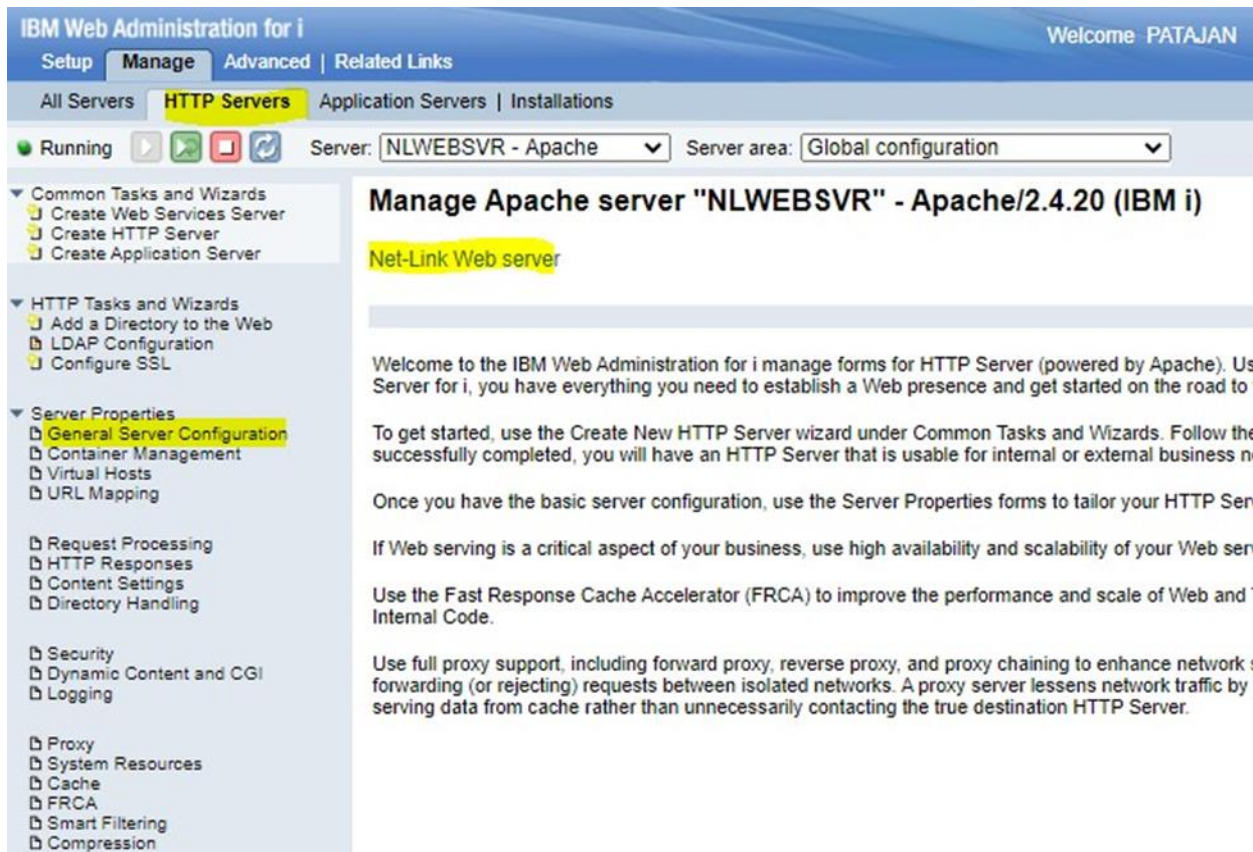

- 12 Configure the Net-Link URL in SiWA Administrator by following the steps in “**Appendix C Secured Net-Link URL configuration in SiWA Administrator**”.

Appendix A Reset Port on Warning

Follow these steps if you need to change or reset the assigned default port Net-Link or any application running.

- 1 Select the General Server Configuration under Server Properties from the Net-Link HTTP server, as shown in below screenshot.

- 2 Navigate to General settings and Click Add to add a new port with http as a protocol (In the below example, added 36309 as a new unused port).

Reset Port on Warning

Manage WebSphere Application Server - V9.0.5.4 Base

Profile: NLAPPSVR Server: NLAPPSVR

Product install path: /QIBM/ProdData/WebSphere/AppServer/V9/Base

Net-Link Application Server

Create Additional Virtual Host

The default virtual host "default_host" was created for this application server. However, you can specify additional virtual hosts for more control over what URI's can run which applications.

Install New Application

After creating the server and virtual host you can applications.

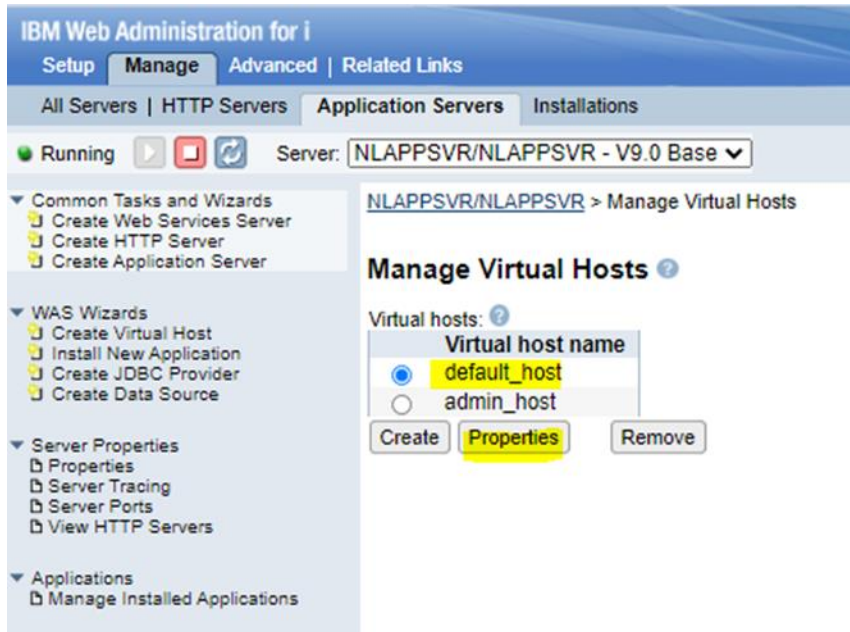

Current Configuration Profile: "NLAPPSVR"

Manage Virtual Hosts	Manage Installed Application
<ul style="list-style-type: none"> ▶ default_host ▶ admin_host 	<ul style="list-style-type: none"> ▶ SwaggerUI ▶ query ▶ Net-Link ▶ RESTAPI Docs ▶ ivtApp

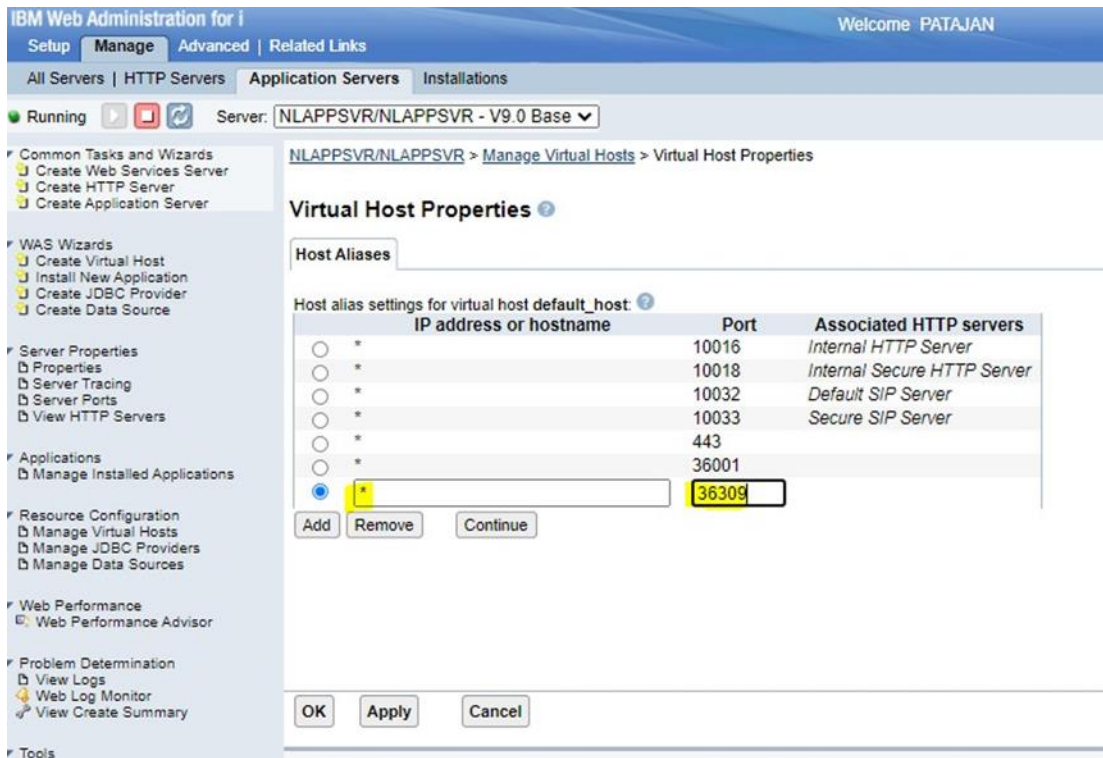

Note: To update the status, click ▶ Refresh

7 Select the default host and Click **Properties**.

Reset Port on Warning

8 Click **Add** to add a Host Aliases (In the below example, added 36309 as a port).

9 Select the 36001 port and Click **Remove**. Click **Apply**.

The screenshot shows the IBM Web Administration console for a server named NLAPPSVR/NLAPPSVR - V9.0 Base. The user is logged in as PATAJAN. The interface is in the 'Manage' tab, and the user is viewing the 'Virtual Host Properties' page for the 'default_host'.

The 'Host Aliases' section shows a table of host alias settings for the virtual host 'default_host'. The table has three columns: 'IP address or hostname', 'Port', and 'Associated HTTP servers'. The current configuration is as follows:

IP address or hostname	Port	Associated HTTP servers
* *	10016	Internal HTTP Server
* *	10018	Internal Secure HTTP Server
* *	10032	Default SIP Server
* *	10033	Secure SIP Server
* *	443	
* *	36001	
* *	36309	NLWEBSVR - Apache

The '36001' port is highlighted in yellow. Below the table are 'Add', 'Remove', and 'Continue' buttons. At the bottom of the page are 'OK', 'Apply', and 'Cancel' buttons.

10 Click **OK** then Click **Close**.

The screenshot shows the same IBM Web Administration console interface as the previous one, but now the 'Virtual Host Properties' page shows a confirmation message at the bottom: 'All configuration files were successfully changed. The server must be stopped and started for the changes to take effect.' The '36001' port is still highlighted in yellow. The 'Add' button is now visible below the table, and the 'OK', 'Apply', and 'Cancel' buttons are at the bottom.

Restart both the Net-Link HTTP and Application servers to make sure changes have reflected successfully.

Appendix B Enable Reverse Proxy in SiW Http server to access Net-Link with same URL and port

To simplify web security for XA deployments where all web related components are running on a single IBM i server, a single HTTP server can be used when deploying through a firewall. The components include SiW Anywhere and Net-Link. These instructions will provide the basics for configuring this type of environment.

Note: SiWA and Net-Link should be running on same host and port to avoid issues while using context apps or widgets in Infor OS.

Using this reverse proxy setup, not only the secured Net-Link application installed on WebSphere, but the default unsecured IDF Net-Link application running on port 36001 can also be accessed through SiWA URL.

Reverse Proxy changes in WSANYWHERE httpd.conf file

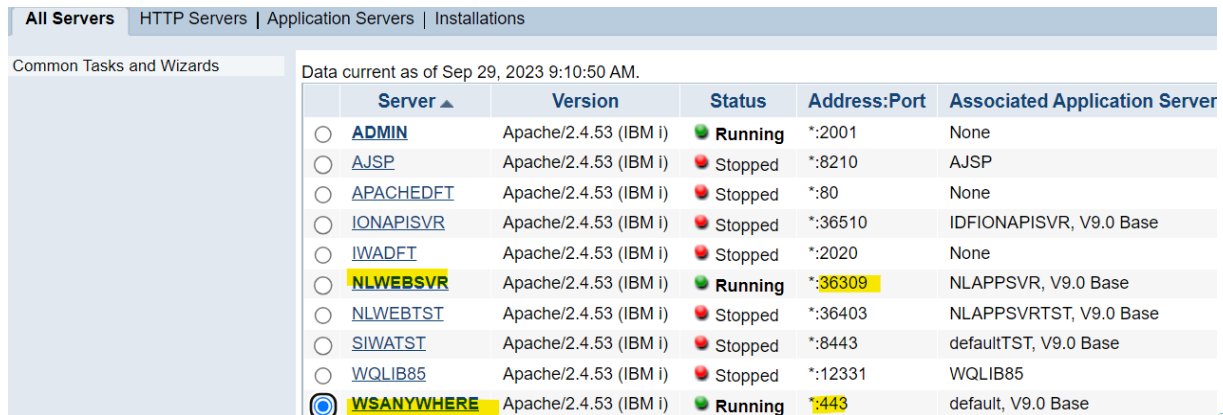

- 1 Login to IBMi Web Administration, using the below URL (where **hostname**, is the FQDN of the IBMi server)

<http://<hostname>:port/HTTPAdmin> or <https://<hostname>:port/HTTPAdmin>

- 2 Navigate to **Manage -> All Servers -> All HTTP Servers. Net-Link Http server and SiWA Http server are running on different ports.**

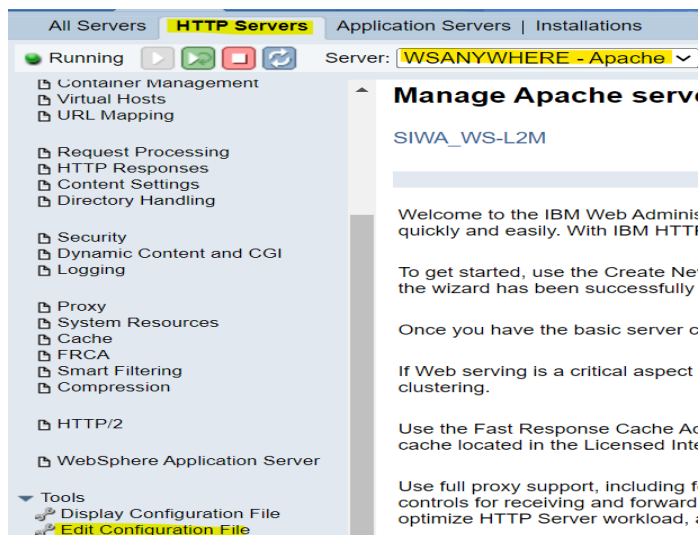

Click on the SiWA configured HTTP server, which is running on port 443 (for example: *WSANYWHERE*) shown below.

Enable Reverse Proxy in SiW Http server to access Net-Link with same URL and port

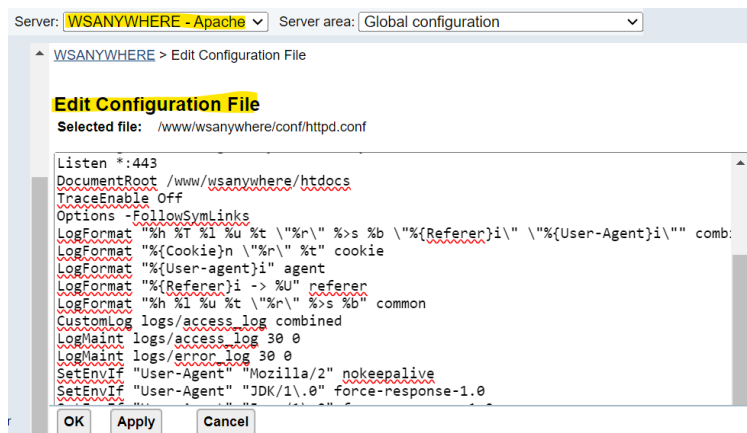

Server	Version	Status	Address:Port	Associated Application Server
ADMIN	Apache/2.4.53 (IBM i)	Running	*:2001	None
AJSP	Apache/2.4.53 (IBM i)	Stopped	*:8210	AJSP
APACHEDFT	Apache/2.4.53 (IBM i)	Stopped	*:80	None
IONAPISVR	Apache/2.4.53 (IBM i)	Stopped	*:36510	IDFIONAPISVR, V9.0 Base
IWADEFI	Apache/2.4.53 (IBM i)	Stopped	*:2020	None
NLWEBSVR	Apache/2.4.53 (IBM i)	Running	*:36309	NLAPPSVR, V9.0 Base
NLWEBTST	Apache/2.4.53 (IBM i)	Stopped	*:36403	NLAPPSVRTST, V9.0 Base
SIWATST	Apache/2.4.53 (IBM i)	Stopped	*:8443	defaultTST, V9.0 Base
WQLIB85	Apache/2.4.53 (IBM i)	Stopped	*:12331	WQLIB85
WSANYWHERE	Apache/2.4.53 (IBM i)	Running	:443	default, V9.0 Base

- 3 Click on “WSANYWHERE” HTTP Server, open the httpd.conf file by navigating to **Tools -> Edit Configuration File**, shown below.

The screenshot shows the 'Manage Apache server' page for the 'WSANYWHERE - Apache' server. The left-hand navigation pane is expanded to show the 'Tools' menu, with 'Edit Configuration File' highlighted. The main content area displays a welcome message and instructions for configuring the server.

```
Server: WSANYWHERE - Apache Server area: Global configuration
WSANYWHERE > Edit Configuration File
Edit Configuration File
Selected file: /www/wsanywhere/conf/httpd.conf

Listen *:443
DocumentRoot /www/wsanywhere/htdocs
TraceEnable Off
Options -FollowSymLinks
LogFormat "%h %T %l %u %t \"%r\" %>s %b \"%{Referer}i\" \"%{User-Agent}i\"" comb
LogFormat "%{Cookie}n \"%r\" %t" cookie
LogFormat "%{User-agent}i" agent
LogFormat "%{Referer}i -> %U" referer
LogFormat "%h %l %u %t \"%r\" %>s %b" common
CustomLog logs/access_log combined
LogMaint logs/access_log 30 0
LogMaint logs/error_log 30 0
SetEnvIf "User-Agent" "Mozilla/2" nokeepalive
SetEnvIf "User-Agent" "JDK/1.0" force-response-1.0
```

- 4 It is suggestible to take a backup of httpd.conf file, before proceeding with any changes.
- 5 Add the below statements to the httpd.conf file in the SiWA environment. If these LoadModule statements already exist be sure they are not commented out.

```
LoadModule proxy_module /QSYS.LIB/QHTTPSVR.LIB/QZSRCORE.SRVPGM
```

```
LoadModule proxy_http_module /QSYS.LIB/QHTTPSVR.LIB/QZSRCORE.SRVPGM
```

Edit Configuration File

Selected file: /www.wsanywhere/conf/httpd.conf

```
LoadModule ibm_ssl_module /QSYS.LIB/QHTTPSVR.LIB/QZSRVSSL.SRVPGM
LoadModule proxy_module /QSYS.LIB/QHTTPSVR.LIB/QZSRCORE.SRVPGM
LoadModule proxy_http_module /QSYS.LIB/QHTTPSVR.LIB/QZSRCORE.SRVPGM
LoadModule proxy_connect_module /QSYS.LIB/QHTTPSVR.LIB/QZSRCORE.SRVPGM
LoadModule proxy_ftp_module /QSYS.LIB/QHTTPSVR.LIB/QZSRCORE.SRVPGM
LoadModule proxy_balancer_module /QSYS.LIB/QHTTPSVR.LIB/QZSRCORE.SRVPGM
LoadModule mod_ibm_si /QSYS.LIB/QHTTPSVR.LIB/QZISI.SRVPGM
LoadModule deflate_module /QSYS.LIB/QHTTPSVR.LIB/QZSRCORE.SRVPGM
AppServer *ALL Start End
```

- 6 Add the below statements to the virtual host section for SSL for SiWA. The virtual host section would be between the <VirtualHost.443> and </VirtualHost> lines. There will be other statements in this section as well.

Note: The Net-Link proxypass would point to the IDF SSL web server and port if NetLink.war is deployed in an app server connected to an SSL enabled HTTP server. If not, use the standard IDF Net-link server and port.

```
<VirtualHost *:443>
```

```
# Set SSL application for NetLink proxy if using SSL
```

```
SSLProxyAppName QIBM_HTTP_SERVER_WSANYWHERE
```

```
SSLProxyEngine on
```

```
# NetLink
```

```
ProxyPass /NetLink https://myibmi.infor.com:port/NetLink
```

```
ProxyPassReverse /NetLink https://myibmi.infor.com:port/NetLink
```

```
</VirtualHost>
```

(Where **myibmi** is the hostname of IBMi server and **port** is Net-Link running port, for example shown as below)

Below example WSANYWHERE is using 443 port and secured Net-Link URL is shown as reference.

It is possible that WSANYWHERE is using a different port other than 443.

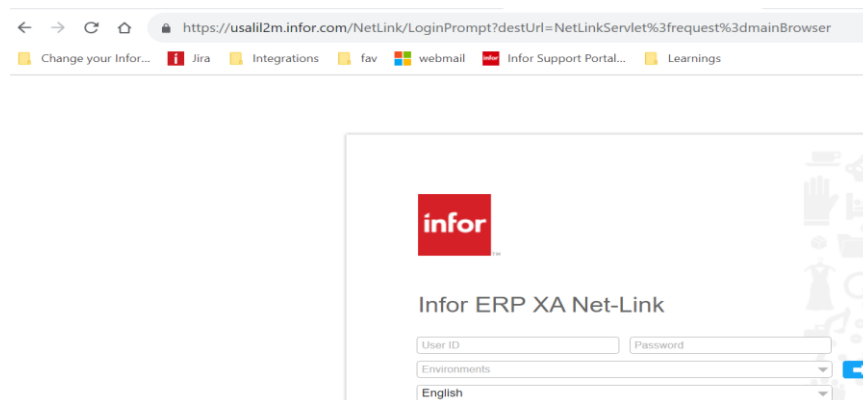

```
42 <VirtualHost *:443>
43 # Set SSL application for NetLink proxy if using SSL
44 SSLProxyAppName QIBM_HTTP_SERVER_WSANYWHERE1
45 SSLProxyEngine On
46 SSLEngine On
47 SSLAppName QIBM_HTTP_SERVER_WSANYWHERE1
48 SSLProtocolDisable SSLv2 SSLv3
49 # NetLink
50 ProxyPass /NetLink https://usalil2m.infor.com:36309/NetLink
51 ProxyPassReverse /NetLink https://usalil2m.infor.com:36309/NetLink
52 </VirtualHost>
```

Caution: The parameter value of *SSLProxyAppName* should match with *SSLAppName*.

Note: You can use unsecured Net-Link URL as well in above configuration.

```
42 <VirtualHost *:443>
43 # Set SSL application for NetLink proxy if using SSL
44 SSLProxyAppName QIBM_HTTP_SERVER_WSANYWHERE1
45 SSLProxyEngine On
46 SSLEngine On
47 SSLAppName QIBM_HTTP_SERVER_WSANYWHERE1
48 SSLProtocolDisable SSLv2 SSLv3
49 # NetLink
50 ProxyPass /NetLink http://usalil2m.infor.com:36001/NetLink
51 ProxyPassReverse /NetLink http://usalil2m.infor.com:36001/NetLink
52 </VirtualHost>
```

- 7 Click on **Apply** and **OK**.
- 8 Restart the SIWA configured HTTP server and its associated Application server.
- 9 Verify if Net-Link application is launching with same port as WSANYWHERE.

- 10 Configure the Net-Link URL in SiWA Administrator by following the steps in “**Appendix C Secured Net-Link URL configuration in SiWA Administrator**”.

Enable Reverse Proxy in SiW Http server to access Net-Link with same URL and port

Appendix C Secured Net-Link URL configuration in SiWA Administrator

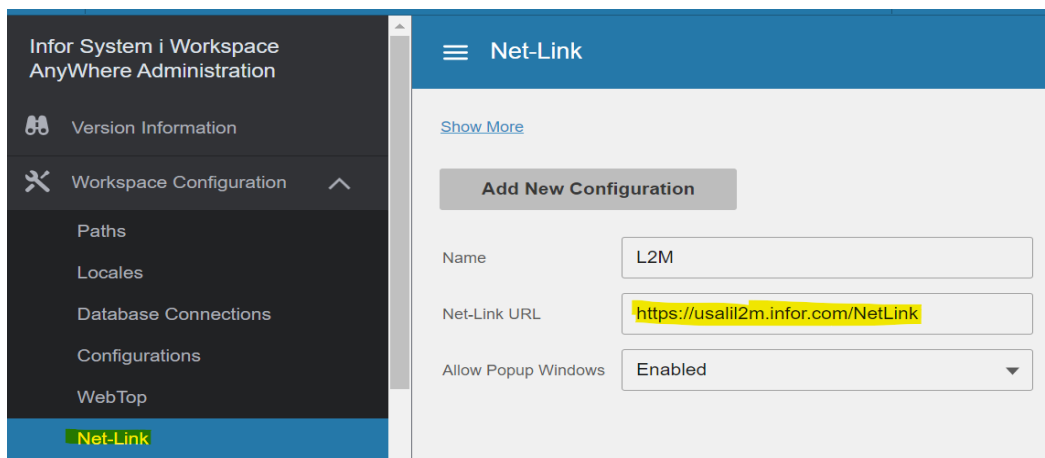

SiW Anywhere Admin settings

Once secured Net-Link is deployed successfully and validated by launching the URL, we need to configure the Net-Link secured URL in SiW AnyWhere Admin application.

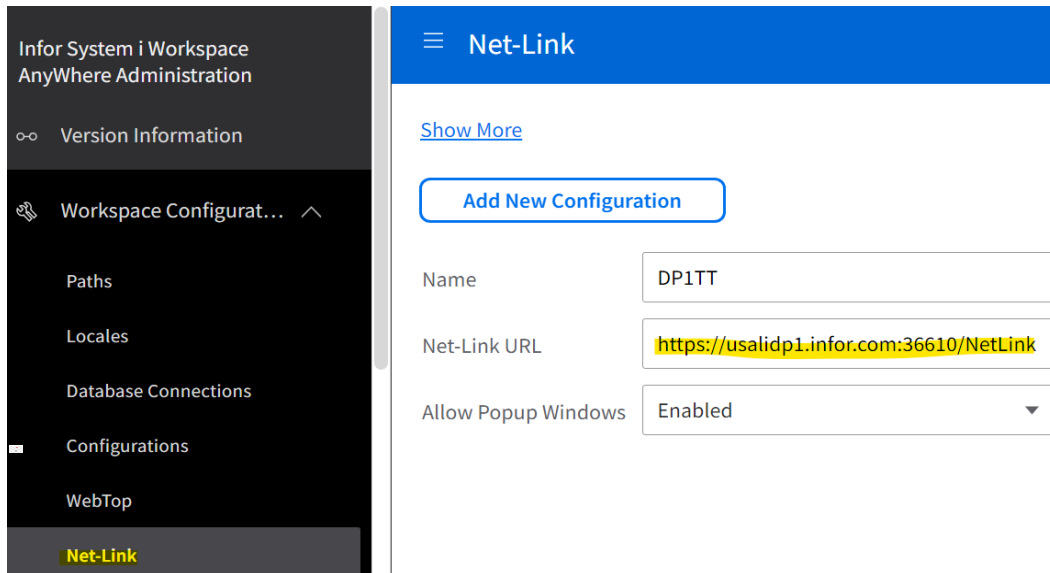

Go to SiWA Admin page -> Workspace Configuration -> Net-Link. Update the Net-Link URL setting with the secured URL and save the configuration.

Note: In the case of SiWA Windows deployment both SiWA and Net-Link will be using the same port. But in the case of SiWA IBMi deployment, by default the WSANYWHERE and Net-Link applications will be using different ports.

It is highly recommended to configure both WSANYWHERE and Net-Link to use same port as WSANYWHERE by following steps in “**Appendix B Enable Reverse Proxy in SiW Http server to access Net-Link with same URL and port**” in this guide and configure below.

If SiWA runs on different port other 443, then mention port in the URL.

Appendix D Adjust Http Thread Count for Secured Net-Link in WebSphere

Based on recent observations, it has been noted that IBM's default thread counts for HTTP and WebSphere Application servers are lower than what is required by some customers. This may need to be adjusted as per the customer's user base. Therefore, it is recommended to increase the default thread counts for both the HTTP server and IBM WebSphere Application server, in addition to the current SSL configuration.

IBM recommends setting the thread count number to - **User count x 125%** to achieve the best result.

HTTP threads configuration:

Once you have completed the SSL configuration, you can set the HTTP threads from the HTTP admin console. The default value is 40, but you can increase it to a higher number, depending on your customer base.

To set the number of threads to process requests, go to your HTTP server instance, -> **Server Properties** -> **General Server Configuration**. There you can configure the value for “**Number of threads to process requests**”.

Adjust Http Thread Count for Secured Net-Link in WebSphere

The configuration was successfully changed. The server needs to be restarted for the changes to take effect.

Web container threads configuration

The Web container threads should always set them to be **10** more than HTTP value i.e. user base X125% + 10. By default, the web container threads are set to 50.

To increase this value, follow these steps:

From the **HTTP Admin console** – **Click on your application server** -> Click on "**Launch administrative console**" -> Once you log in -> Navigate to your application server.

Click on "Thread Pools" under "Additional Properties" in the bottom right corner -> Select "Web Container." ->Set the maximum value to your desired number as recommended.

Be sure to save the setting to your master configuration.

For the changes to take effect, please restart both the HTTP and app servers. Let me know if you have any further questions.

The screenshot shows the WebSphere administrative console interface. On the left, the navigation pane has 'Servers' highlighted. The main content area is titled 'Application servers' and contains a table of application servers. The table has columns for Name, Node, Host Name, and Version. One server, 'NLAPPSVR', is highlighted in the table.

Name	Node	Host Name	Version
NLAPPSVR	USALIDP1_NLAPPSVR	USALIDP1.INFOR.COM	Base 9.0.5.15
Total 1
